Tenure (ten'ür), *n.* [Fr. *tenure*, L. *tenura*, from *L. teneo*, to hold.] 1. The act, manner, or right of holding property, especially real estate. Land may be held according to two main principles, the tenure being either *feudal* or *allodial*. According to the latter tenure, the whole right and title of the land rests with the owner; according to the former, the person possessing the subject holds it from a superior, and this is the principle universal in England. According to the theory in England all land is held of the crown, either mediately or immediately.

The ownership of land is therefore never unlimited as to extent, for he who is the owner of land in fee, which is the largest estate that a man can have in land, is not absolute owner; he owes services in respect of his fee (or fief), and the seignory of the lord always subsists. All land in the hands of any layman is held of some lord, to whom the holder or tenant owes some service; but in the case of church lands, although they are held by tenure, no temporal services are due, but the lord of whom these lands are held must be considered the owner, although the beneficial ownership can never revert to the lord. All the species of ancient tenures may be reduced to four, three of which subsist to this day:—(1) *Tenure by knight service*, which was the most honourable. This is now abolished. (2) *Tenure in free socage*, or by a certain and determinate service, which is either free and honourable, or villen and base. (3) *Tenure by copy of court roll*, or *copyhold tenure*. (4) *Tenure in ancient demain*. There was also *tenure in frankalmoinage*, or free alms.

The tenure in free and common socage has absorbed most of the others. (See **TENANT**, **COPYHOLD**, **SOCAGE**, **VILLENAGE**.) In Scots law the equivalent technical term is *holding*.

2. The consideration, condition, or service which the occupier of land gives to his lord or superior for the use of his land. — 3. Manner of holding in general; the terms or conditions upon which anything is held or retained; as, in absolute governments men hold their rights by a precarious tenure.

It is a long, worm-shaped, grayish-white animal, about 1 foot in length and $\frac{1}{2}$ inch in thickness. Its great length is owing to the elongation of the siphons or breathing tubes conveying water to the gills. The two valves or halves of the

shell are small and globular in shape. The viscera and body are mainly contained within the valves. In excavating into the wood

Teredo navalis, and piece of wood perforated by Terebratulids.

(the shell is the boring instrument) each individual is careful to avoid the tube formed by its neighbour, and often a very thin leaf alone of wood is left between the cavities, which are lined with a calcareous incrustation. Many plans are tried to protect ships, piers, &c., from this destructive animal, such as copper sheathing, treating with creosote or corrosive sublimate, or driving a number of short broad-headed nails into the timber, the rust from which spreads and prevents the animal from settling. It is said to have been originally imported from tropical climates; but it has now become an inhabitant of most of the harbours of this country.—*T. gigantea*, a species 5 feet long and upwards, is found in the East Indies in shallow water, where it bores into the hardened mud of the seabed.

Termites, Termitidæ (tér'mi-téz, tér-mit'idé), *n. pl.* [*L. termes, termitis*, a wood-worm.] A family of neuropterous insects, known by the name of white ants, corresponding with the Linnean genus *Termes*. These insects have little affinity with the true ants, which are hymenopterous, although they resemble them in their mode of life. They are chiefly confined to the tropics, and are found very plentifully in Western Africa. They unite in societies, building their dwellings on the ground, in the form of pyramids or cones, 10 or 12 feet high. These dwellings, which are so firmly cemented as to be capable of bearing the weight of three or four men, are divided off into several apartments as magazines, chambers, galleries, &c. Every colony of termites consists of a king and queen, both of which are much larger than the other members of the colony, and of workers and soldiers, which are without wings. The king and queen are the parents of the colony, and are constantly kept together, attended by a detachment of workers, in a large chamber in the heart of the hive, surrounded by

stronger walls than the other cells. The queen is always gravid, the abdomen being enormously distended with eggs, which, as they are dropped, relays of workers receive and convey in their mouths to the minor

cells throughout the hive. At the beginning of the rainy season a number of winged insects, both male and female, is produced,

the wings having, in order to the future development of the insect, transverse seams across the roots, dividing the nervures. These insects when mature leave the hive and fly abroad, afterwards shedding the wings by means of the seams referred to, and becoming the kings and queens of future colonies. The soldiers and workers, both neuter, or of sex fully developed sex, and differing merely in the armature of the head, are distinct animals from the moment they leave the egg, the young differing from the adult of the same class only in size. The duties of the workers are to build the habitations, make covered roads, nurse the young, attend on the king and queen, and secure the exit of the mature winged insects, while to the soldiers, whose mandibles are powerfully developed for that purpose, is committed the defence of the community, which duty they perform with both system and desperate courage. There are many species of termites, all of which are fearfully destructive to wood. They have been known to destroy the whole woodwork of a house in a single season.

The earlier geologists used this term as designating all strata above the secondary; but later discoveries have tended to modify its sense by way of restriction. As now employed the term *tertiary formation* designates the rock-system extending from the chalk (the highest member of the secondary), on which it rests, to the base of the post-tertiary system, which latter, according to some, includes the strata belonging to the glacial epoch, while others leave them in the tertiary. It is noteworthy that there is a complete and entire physical break between the rocks of the secondary or mesozoic and tertiary periods, the latter resting in no instance conformably on the former, while there is an equally complete break in the life of the two periods, not a single secondary animal or plant being known to have survived the cretaceous period with the exception of a few Foraminifera. In the tertiary rocks, on the other hand, not only are all the animals and plants more or less like existing types, but we meet with a constantly increasing proportion of living species as we pass from the bottom to the top. The classification of the tertiary formation is based on this increase, the strata being divided into two great groups as follows:— (1) THE OLDER TERTIARY, comprising the *Eocene*, with five per cent of living species, and the *Miocene*, with twenty-five per cent. (2) THE NEWER TERTIARY, comprising the *Older Pliocene*, containing fifty per cent of living species, and the *Newer Pliocene*, containing ninety-five per cent.

*Thammuz came next behind,
Whose annual wound on Lebanon allured
The Syrian damsels to lament his fate

While smooth Adonis from his native rock
Ran purple to the sea, supposed with blood
Of Thammuz yearly wounded.*

Than (THAN), *conj.* [A. Sax. *thenne*, *thanne*, *thonne*, than, then, the latter being the original meaning. This word is therefore the same as *then*; so that 'this is better than that' is equivalent to 'this is better, *than* that'] A particle used after certain adjectives and adverbs which express comparison or diversity, such as *more*, *better*, *other*, *otherwise*, *rather*, *else*, and the like, for the purpose of introducing the second member of the comparison. *Than* is usually followed by the object compared in the nominative case, but sometimes the object compared is placed in the objective case, and the particle is then considered by some grammarians as a preposition. 'Thrice fairer than myself.' *Shak.*

Among them that are born of women there hath not risen a greater *than* John the Baptist; notwithstanding he that is least in the kingdom of heaven is greater *than* he. *Jn. xi. 11.*

G. *degen*, a soldier, male, disciple. Same root as obsolete verb *to the* or *there*.] A title of honour among the Anglo-Saxons. In England a freeman not noble was raised to the rank of a thane by acquiring a certain portion of land—five hides for a lesser thane—by making three sea voyages, or by receiving holy orders. Every thane had the right of voting in the witenagemot, not only of the shire, but also of the kingdom, when important questions were to be discussed. With the growth of the kingly power the importance of the king's thanes (those in the personal service of the sovereign) rose above that of the highest gentry, ealdormen and bishops forming an inferior class. On the cessation of his actual personal service about the king the thane received a grant of land. After the Norman conquest thanes and barons were classed together. In the reign of Henry II. the title fell into disuse. In Scotland the thanes were a class of non-military tenants of the crown, and the title was in use till the end of the fifteenth century. The notion derived from Boece, and adopted by Shakspeare in 'Macbeth', that the Scotch thanes were all transformed into earls, has no historical foundation.

Thanedom (thân'dum), *n.* The district or jurisdiction of a thane.

Rarely met with in the south, *thanedoms* are found mostly in Angus and Mearns and the northern shires down to the Moray Firth. We must not expect to find them in the fertile plains of the Lowlands, which were speedily and entirely occupied by the southern settlers, become feudal barons, nor yet in the inner fastnesses of the mountains, where the Celtic institutions, unmodified, excluded the Saxon title or office. *Cosmo Innes.*

Fris. *thæt*, Icel. *that*, D. *dat*, G. *das*. Cog. Skr. *sa*, *êd*, *tat*. See also **THE**.] 1. A word used as a definitive adjective before a noun: (a) pointing to a person or thing as before mentioned or supposed to be understood; or used to designate a specific thing or person emphatically, having more force than the definite article *the*, which may, however, in some cases be substituted for it.

It shall be more tolerable for Sodom and Gomorrah in the day of judgment, than for *that* city. *Mat. x. 15.*
The woman was made whole from *that* hour. *Mat. ix. 22.*

(b) Frequently used in opposition to *this*, in which case it refers to one of two objects already mentioned, and often to the one most distant in place or time; frequently, however, mere contradistinction is implied; as, I will take *this* book, and you can take *that* one.

Of Zion it shall be said, *this* and *that* man was born in her. *Ps. lxxvii. 5.*

(c) Pointing not so much to persons and things as to their qualities, almost equivalent to *such*, or of such a nature, and occasionally followed by *as* or *that* as a correlative. 'There cannot be *that* vulture in you to devour so many.' *Shak.* 'Entertained with that ceremonious affection as you were wont.' *Shak.* 'Whose love was of *that* dignity *that*

it went hand in hand with the vow.' *Shak.*
2. Used absolutely or without a noun as a demonstrative pronoun (a) to indicate a person or thing already referred to or implied, or specially pointed at or otherwise indicated, and having generally the same force and significance as when used as an adjective; as, give me *that*; do you see *that*? (b) Used in opposition to this, or by way of distinction.

If the Lord will, we shall live, and do *this* or *that*.
Jan. iv. 15.
This is not fair; nor profitable, *that*. *Dryden.*

When *this* and *that* refer to foregoing words, *this*, like the Latin *hic* or the French *ceci* (this), refers to the last mentioned, the latter, and *that*, like the Latin *ille* and French *cela*, to the first mentioned, the former. *This* is an artificial grammatical rule, probably founded on the Latin one, and adopted by writers, but it can scarcely be said to rest on any logical conception or law of thought.

Self-love and reason to one end aspire,
Pain their aversion, pleasure their desire;
But greedy *that*, its object would devour;
Their taste the honey, and not wound the flower. *Pepe.*

In all the above cases, *that*, when referring to a plural noun, takes the plural form *those*; as, *that* man, *those* men; give me *that*, give me *those*; and so on. (c) Used to represent a sentence or part of a sentence, or a series of sentences.

And when Moses heard *that*, he was content.
Lev. x. 20.
That here stands for the whole of what Aaron had said, or the whole of the preceding verse.

I will know your business, *that* I will. *Shak.*
That sometimes in this use precedes the sentence or clause to which it refers.

That be far from thee, to do this manner,
to slay the righteous with the wicked. Gen. xviii. 25.

That here represents the clause in italics. It is used also as the substitute for an adjective; as, you allege that the man is innocent; *that* he is not. Similarly it is often used to introduce an explanation of something going before. 'Religion consists in living up to those principles, *that* is, in acting in conformity to them.' (d) Used emphatically, with a predicate, in phrases expressive of approbation, applause, or encouragement. 'Why, *that's* my dainty Arieli!' *Shak.* 'That's my good son!' *Shak.* (e) By the omission of the relative *that* often acquires the force of *that* which: this is, however, not in accordance with modern usage.

I earn *that* I eat, get *that* I wear. *Shak.*
We speak *that* we do know, and testify *that* we have seen. *John* ix. 11.

3. Used as a relative pronoun, and in many cases equivalent to *who* or *which*. It cannot, however, be relatively used with a preposition preceding it, but may be so used when the preposition is transposed to the end of the clause; thus we say, the man of *whom* I spoke, the book from *which* I read, the spot near *which* he stood, the pay for *which* he works; but we cannot say the man of *that* I spoke, &c., though we may say, the man *that* I spoke of, the book *that* I read from, the place *that* he stood near, the pay *that* he works for, and so on. When the relative clause conveys an additional idea or statement, *who* and *which* are rather to be used than *that*, which, indeed, is sometimes inadmissible; thus we say: 'James, *whom* I saw yesterday, told me,' but not 'James *that*.' *That* properly introduces a restrictive and explanatory clause (as exemplified by 'The man *that* I spoke of,' &c.), and though *who* and *which* are frequently used in the same way, the use of *that* often avoids ambiguity. See under *Who*.

He *that* reproveth a scorner getteth to himself shame. *Prov.* ix. 7.

In the following extract *that*, *who*, and *which* are used without any perceptible difference.

Sometime like apes *that* mow and chatter at me
And after bite me, then like hedgehogs *which*
Lie tumbling in my barefoot way and mount
Their prickles at my footfall, sometime am I
All wound with adders, *who* with cloven tongues
Do hiss me into madness. *Shak.*

With its use as a relative are to be classed those cases in which it is used as a relative to *so* or *such*. 'Who's *so* gross *that* cannot see this palpable device?' *Shak.* 'Who's *so* firm *that* cannot be seduced?' *Shak.* 'Such allowed infirmities *that* honesty is never free of.' *Shak.*—*That*, as a demonstrative and as a relative pronoun, may

sometimes occur close together, but this use is now scarcely considered elegant.

That that is determined shall be done. *Dan.* xi. 36.

That that dieth, let it die. *Zech.* xi. 9.

That (THAT), conj. 1. Introducing a reason; in that; because. 'Not *that* I loved Caesar less, but *that* I loved Rome more.' *Shak.*

3. Introducing a result or consequence.

Was the first motive *that* I woo'd thee, Anne. *Shak.*

I have shewed before *that* a mere possibility to the contrary can by no means hinder a thing from being highly credible. *Ep. Wilkins.*

5. Added formerly to other conjunctions or to adverbs for the sake of emphasis. 'After *that* things are set in order here, we'll follow them.' 'Take my soul, before *that* England give the French the foil.'

'What would you with her *if that* I beshe?'
'Since *that* my case is past the help of law.'
'When *that* my eye is furnished for a look.'
Shak.—6. Used elliptically to introduce a sentence or clause expressive of surprise, indignation, or the like. 'That a brother should be so perfidious?' 'O God, *that* men should put an enemy in their mouths to steal away their brains!' *Shak.*—7. Used as an optative particle or to introduce a phrase expressing a wish. 'O, *that* you bore the mind *that* I do!' *Shak.*—*In that*, for the reason *that*; because.

Sax. *thæ*, O. Fris. *the*, *thi*, D. and L. G. *de*, Sw. and Dan. *den*, G. *der*. In Anglo-Saxon the article underwent inflection, and the *the* used before a comparative represents the instrumental case *thi, thy*, the English phrase the more the better thus corresponding closely to the Latin *quo magis, eo melius*.] 1. Used before nouns with a specifying or limiting effect; as, the laws of the twelve tables; the independent tribunals of justice in our country are the security of private rights and the best bulwark against arbitrary power; the sun is the source of light and heat.—2. distinction, and placed before family names with somewhat of the force of a title, indicating the head of the clan or family; as, *The Macnab*; *The Douglas*; *The O'Donoghue*.—4. Prefixed to adjectives used absolutely, giving them the force and functions of abstract nouns; as, a passion for the sublime and beautiful; the real and the ideal. 5. [*The* is generally pronounced with the vowel sound short, before a vowel somewhat like *i* in *pin*, before a consonant often more like *u* in *but*; but when used emphatically it is pronounced as *thē*. In poetry the *e* was formerly always, and is still sometimes, cut off in printing before a word beginning with a vowel sound. 'Shook *th'* arsenal and furnished over Greece.' *Milton*. The old contracted form *y'* arose from a confusion between the old character for *th* and that for *y*—of course *y'* was always pronounced as *thē*.]

prising the species yielding the tea of commerce. Although botanists are now for the most part agreed that tea is the produce of one species (*T. sinensis* or *chinensis*), yet different modes of culture persevered in for many centuries, as well as variations in climate and soil, have caused the original plant to diverge into two varieties so well marked as to be entitled to distinct names—viz. *T. viridis* and *T. bohea*. *T. viridis* is a large, hardy, evergreen plant, with spreading branches, its leaves 3 to 5 inches long, thin, very broadly lanceolate, light green and waxy, with large and irregular serratures, the flowers large, usually solitary, and of a white colour. It is found both in China and Japan. *T. bohea* is a smaller plant than *T. viridis*, and differs from it in several particulars. From either species, however, by means of a different process of manipulation in the manufac-

Thea bohea.

ture, both black and green tea are produced. Tea is cultivated in China over a great extent of territory. It is also extensively cultivated in Japan, Tonquin, Cochinchina, and Assam. In China the climate most congenial to it seems to be that between the 27th and 31st degree of north latitude. Its growth is chiefly confined to hilly tracts not suited to the growth of corn, and the

rearing of it requires great skill and attention, as well as the preparation of the leaves. It is perhaps impossible to state definitely the native country of the tea-plant. Hitherto the only country in which botanists have found it in a really wild state is Upper Assam, the plant indigenous to that country being known as *T. assamica* or *assanensis*. This botanists are inclined to regard as the original of *T. viridis* and *T. bohea*. See **TEA**.

Besides taking the usual monastic vows, the Theatins bound themselves to preach against heretics, to take upon them the cure of souls, to attend the sick and criminals, to abstain from possessing property, and not even to ask for alms, but to trust to Providence for support, expecting, however, that this support would be derived from the voluntary alms of the charitable. There were also Theatin nuns, who spent their whole time in solitude and prayer. The order flourished considerably in France, Spain, and Portugal, but its influence is now chiefly confined to the Italian provinces.

Theatre (thē'a-tēr), *n.* [Fr. *théâtre*, from L. *theatrum*, from Gr. *theatron*, from *theaomai*, to see, *thea*, a view.] 1. A building appropriated to the representation of dramatic spectacles; a play-house. Among the Greeks and Romans theatres were the chief public edifices next to the temples, and in point of magnitude they surpassed the most spacious of the temples, having in some instances accommodation for as many as from 10,000 to 40,000 spectators. The Greek and Roman theatres resembled each other in their general form and principal parts. They were regularly of a more or less semicircular form, resembling the half of an amphitheatre, and were not covered by a roof. The space appropriated to the seats of the spectators was termed *cavea* by the Romans and *koilon* by the Greeks. The seats were all concentric with the orchestra, and were intersected in one direction by ascents or flights of steps, dividing the seats into so many compartments. The place for the players, in front of the seats, was called *scena* (*skēnē*). The semicircular space between the *scena* and the seats of the spectators was called *orchestra* (*orchēstra*), appropriated by the Greeks to the chorus and musicians, and by the Romans to the senators. Besides these essential parts there were the *pulpitum* or stage proper, the *proscenium*, and *postscenium*, with regard to which

but the stage machinery seems in many cases to have been elaborate. In the early days of the modern theatre the buildings were only partially roofed, and the stage but scantily if at all provided with scenery. The interior of the theatres of the present day are usually constructed on a horseshoe or semicircular plan, and several tiers of galleries run round the walls. The orchestra is now solely occupied by the musicians of the establishment, and the stage, which has a slight downward slope from the back, is furnished with movable scenes, which give an air of reality to the spectacle. *The theatre*, the drama; the stage; dramatic literature.—2. A room, hall, or other place, generally with a platform at one end, and ranks of seats rising step-wise as they recede, or otherwise so arranged that a body of spectators can have an unobstructed view of the platform. Places of this description are constructed for public lectures, scholastic exercises, anatomical demonstrations, surgical operations before a class, and the like.—3. In *law*, the general name for the most ordinary class of offences against property, for which English law uses the term larceny. Simple larceny, or theft, is committed by wrongfully taking, against the will of the owner, and carrying away the goods of another with the fraudulent and felonious intent wholly to deprive him of his property therein. Hence it requires an actual taking, and an actual carrying away for some distance, to constitute the offence. Compound larceny or theft is when the theft is accompanied by aggravating circumstances, as when it is committed upon the person, or consists in stealing from a dwelling-house. Taking from the person in a violent manner is robbery, and stealing in a dwelling-house after having broken therein is burglary. (See *LARCENY*.) In *Scots law*, theft is defined 'the intentional and clandestine taking away of the property of another from its legitimate place of deposit, or other locus tenendi, with the knowledge that it is another's, and the belief that he would not consent to its abstraction, and with the intention of never restoring it to the owner.' 2. That part of philosophy which treats of the being, perfections, and government of God, and the immortality of the soul.

Theodolite (thē-ōd'ol-it), *n.* [Perhaps from Gr. *thea*, a seeing, *holos*, a way, and *litos*, plain, smooth, or from *thea*, and *doulos*, a slave. In the form *theodolitus*, the term occurs in *Pantometria* by T. Digges, a work on mensuration first printed in 1571, where it is said to be 'a circle divided in 360 grades or degrees, or a semicircle parted in 180 portions.'] A most important surveying instrument for measuring horizontal and vertical angles by means of a telescope the movements of which can be accurately marked. This instrument is variously constructed, but its main characteristics continue unaltered in all forms. One of the forms generally used is shown in the cut. A and B are two concentric horizontal circular plates which turn freely on each other. The lower or graduated plate B contains the divisions of the circle, and the upper or vernier plate has two vernier divisions a diametrically opposite, only one of which is shown in the cut. The vertical axis c

consists of two parts, the one working within the other. The external part is attached to the graduated plate B, and the internal to the vernier plate A. The plate

of the circle is adjusted to the horizon by the screws *b b b* acting against a plate of metal resting on the staff-head supporting the instrument. The vernier plate carries two spirit-levels *c c* at right angles to each other, by means of which the circle may be brought accurately into the horizontal plane. The horizontal axis of the vertical limb E of the instrument is supported by a frame firmly attached to the vernier plate, and turning along with it about the vertical axis. Parallel to the axis a telescope D, with an arrangement of fibres of unspun silk called cross-wires in the principal focus of its object-glass, is attached, which moves in the vertical plane by the movement of the graduated circle E, and is used for observing the objects whose angular distance is to be measured, and also for taking altitudes or measuring vertical angles; a spirit-level is fixed beneath the telescope for horizontal adjustment. *d* is a microscope for reading off the degrees on the horizontal circle; *e* one for those on the vertical limb. The screw *g* clamps the collar to the vertical axis *c*, and prevents motion; *h* turns the whole round. To measure the angular distance between any two objects, the telescope is turned round along with the vernier circle (the graduated circle remaining fixed) until it is brought to bear exactly upon one of the objects; it is then turned round until it is brought to bear on the other object, and the arc which the vernier has described on the graduated circle measures the angle required. The double vertical axis and the use of the clamps enable the observation to be repeated any number of times, in order to ensure accuracy. The theodolite is not only a most essential instrument in trigonometrical surveying for determining stations and running base-lines, but also in geodetical operations for assisting in determining the length of an arc of the meridian. For this latter purpose it requires to be constructed on a large scale.

Theology (thē-ol'o-jī), *n.* [*Fr. theologie*, from *Gr. theologia*—*theos*, God, and *logos*, discourse.] Divinity; the entire science of the Christian religion; the science which treats of God and man in all their known relations to each other; the science which treats (a) of the character and attributes of God; (b) the doctrine of man in his relations to God; (c) the doctrine of the salvation of man through the person and work of Christ; (d) the doctrines of the final state of all men; and (e) the doctrine of the church, its constitution and government. In reference to the sources whence it is derived, theology is distinguished into *natural* or *philosophical* *theology*, which relates to the knowledge of God from his works by the light of nature and reason; and *supernatural*, *positive*, or *revealed* *theology*, which sets forth and systematizes the doctrines of the Scriptures. Theology is variously divided according to the method of treating the subject, and the part of the subject which is treated.—*Dogmatic* or *theoretical* *theology*, that part of the science which aims pre-eminently to state what is authoritatively taught, whether by the Scriptures, the councils, or the creeds.—*Exegetical* *theology* embraces the interpretation of the Scriptures, the science which teaches the principles to be observed in interpretation; and biblical criticism, which examines and tries to establish the genuine text, the authenticity of the various books of the Bible, and the discussion of kindred subjects.—*Historical* *theology* treats of the history of Christian doctrines, of heresies of the church, of councils, and the like.—*Metaphysical* *theology* aims to substantiate the teachings of the Bible by an appeal to those primitive cognitions and primary beliefs which the Bible always assumes.—*Moral* *theology*, a term formerly in use, covered the ground now occupied by moral philosophy or Christian ethics.—*Polemical* *theology*, or theological controversy, seeks to overthrow the positions of other systems as well as to defend its own.—*Practical* *theology* consists of an exhibition, first, of precepts and directions, and secondly, of the motives from which we should be expected to comply with these.—

Rational *theology* gives to human reason the highest authority in determining what is theological truth.—*Scholastic* *theology* either proceeds by reasoning or derives the knowledge of divine things from certain established principles of faith.—*Speculative* *theology*, a system in which theory predominates over Scripture and all other authority.—*Systematic* *theology* arranges methodically the great truths of religion, so as to enable us to contemplate them in their natural connection, and to perceive both the mutual dependence of the parts and the symmetry of the whole. A theory is often nothing else but a contrivance for comprehending a certain number of facts under one expression. Many theories are founded entirely on analogy, and such theories may have all degrees of evidence from the least to the greatest. The evidence of a theory increases with the number of facts which it explains, and the precision with which it explains them. It diminishes with the number of facts which it does not explain, and with the number of different suppositions that will afford explanations equally precise. A theory may not deserve to be rejected because it does not explain all the phenomena, if it explains a great number and be not absolutely inconsistent with any one, but a single fact inconsistent with any theory may be sufficient to overturn it.—*Theory* is distinguished from *hypothesis* thus: a *theory* is founded on inferences drawn from principles which have been established on independent evidence; a *hypothesis* is a proposition assumed to account for certain phenomena, and has no other evidence of its truth than that it affords a satisfactory explanation of those phenomena. It is necessary to keep this distinction in view, as the terms *theory* and *hypothesis* are very frequently confounded both in speaking and writing.

Such views have prevailed at various times and in various countries.

Thus when wires or bars of metal of different kinds, as bis-

mut and antimony, are placed in close contact, end to end, and disposed so as to form a periphery or continuous circuit, and heat then applied to the ends or junctions of the bars, electric currents are produced. — 2. The science that treats of the electric currents that arise from heating the junction of two heterogeneous conductors.

—**Thermo-electric alarm**, an apparatus designed to indicate the rise of temperature beyond a certain desired point; as for instance to show when the bearings of shaftings are overheating or in danger from fire.

It consists of a thermometer having a wire passing through the bulb, and so connected with the mercury; and another entering the tube at the top, and extending a certain distance downwards.

Each of these wires is connected with a small open circuit having an electric battery and bell. Suppose the presence of fire in an apartment may be inferred from the temperature rising to 100°, this actual rise may be indicated by having the end of the top wire set in the tube opposite this degree on the scale.

When the mercury rises and touches 100° the circuit is completed and the bell rung. — **Thermo-electric battery**, or *pile*, an apparatus much used in delicate experiments with radiant heat. It consists of a series of little bars of antimony and bismuth (or any other two metals of different heat-conducting power), having their ends soldered together and arranged in a compact form; the opposite ends of the pile being connected with a galvanometer, which is very sensibly affected by the electric current induced in the system of bars when exposed to the slightest variations of temperature.

To the combined arrangement of pile and galvanometer the name of thermo-multiplier is given. — **Thermo-electric pair**, two metal bars of different heat-conducting power, having their ends soldered together, and the combined bar then usually bent into a more or less horse-shoe or magnet form for the purpose of bringing their free ends within a conveniently short distance. They are used in thermo-electric experiments, but as the electric current developed in a single pair is very weak, a considerable number are usually combined, thus forming the thermo-electric pile or battery.

Bismuth and antimony are the metals usually employed, the difference in electro-motive force being greater between them than between any other two metals conveniently obtainable.

Thermometer (thêr-mom'et-êr), *n.* [Gr. *thermos*, warm, from *thermê*, heat, and *metron*, measure.] An instrument by which the temperatures of bodies are ascertained; founded on the property which heat possesses of expanding all bodies, the rate or quantity of expansion being supposed proportional to the degree of heat applied, and hence indicating that degree. The thermometer consists of a slender glass tube, with a small bore, containing in general mercury or alcohol, which expanding or contracting by variations in the temperature of the atmosphere, or on the instrument being brought into contact with any other body, or immersed in a liquid or gas which is to be examined, the state of the atmosphere, the body, liquid, or gas, with regard to heat, is indicated by a scale either applied to the tube or engraved on its exterior surface. The ordinary thermometer consists of a small tube, terminating in a ball containing mercury, the air having been expelled and

the tube hermetically sealed. There are two points on the scale corresponding to fixed and determinate temperatures, one, namely, the temperature of freezing water, and the other to that of boiling water. In the thermometer commonly used in this country, that of Fahrenheit, the former point is marked 32° and the latter 212°; hence the zero of the scale, or that part marked 0°, is 32° below the freezing-point, and the interval or space between the freezing and boiling points consists of 180°. The zero point is supposed to have been fixed by Fahrenheit at the point of greatest cold that he had observed, probably by means of a freezing-mixture such as snow and salt. On the Continent, particularly in France, and nowadays in all scientific investigations, the Centigrade thermometer is used. The space between the freezing and boiling points of water is divided into 100 equal parts or degrees, the zero being at freezing and the boiling-point at 100°. Réaumur's thermometer, which is in use in Germany, has the space between the freezing and boiling points divided into 80 equal parts, the zero being at freezing. The following formulae will serve to convert any given number of degrees of Fahrenheit's scale into the corresponding number of degrees on Réaumur's and the Centigrade scales, and *vice versa*: Let F, R, and C (the 0° of C and R, being equal to F 32°, and the three scales from freezing to boiling point being F 180°, C 100°, R 80°, or in the ratio of 9, 5, 4) represent any corresponding numbers of degrees on the three scales respectively, then: $(F - 32^\circ) \times \frac{5}{9} = R$; $(F - 32^\circ) \times \frac{5}{9} = C$; $R \times \frac{9}{5} + 32^\circ = F$; $C \times \frac{9}{5} + 32^\circ = F$; $C \times \frac{4}{5} = R$; $R \times \frac{5}{4} = C$. For extreme degrees of cold, thermometers filled with spirit of wine must be employed, as no degree of cold known is capable of freezing that liquid, whereas mercury freezes at about 39° below zero on the Fahrenheit scale. On the other hand, spirit of wine is not adapted to high temperatures, as it is soon converted into vapour, whereas mercury does not boil till its temperature is raised to 660° F. Mercury is most commonly used for thermometers employed for indicating all ordinary temperatures. For recording extremely high temperatures the pyrometer is used; and for indicating very slight variations the thermo-electric battery is employed. As the ordinary thermometer gives the temperature only at the time of observation, the necessity for having an instrument which would show the maximum and minimum temperatures within a given period is easily apparent in all cases connected with meteorology, and various forms of instruments for this purpose have been invented. A common form of *maximum thermometer* consists of the ordinary thermometer fitted with a piston which moves easily in the tube. The instrument is placed horizontally, and the piston is pushed along the bore as the mercury advances, and is left at the highest point by the retreating fluid. This point is noted by the observer, who then erects the thermometer, causing the piston to sink to the mercury, the instrument thus being in condition for a fresh experiment. A similar action takes place in the spirit of wine *minimum thermometer*, the small movable piston being, however, immersed in the fluid and drawn back by the convex surface of the contracting fluid, being left at the point of greatest contraction. The maximum and minimum instruments combined form the *register or self-registering thermometer*. — *Chromatic thermometer*, an arrangement of glass plates devised by Sir David Brewster, exhibiting the difference between their temperature and that of an object with which they are brought in contact by the different hues of the polarized light produced in the plates. — *Differential thermometer*. See DIFFERENTIAL.

A thermostat was contrived by Dr. Ure for regulating temperature in the processes of distillation and vaporization in baths, hot-houses, in adjusting the heat of stoves and furnaces, &c. It operates upon the principle that when two thin metallic bars of different degrees of expansibility are riveted or soldered faceways together, any change of temperature will cause the compound bar to bend, the side on which the least expansible bar is becoming concave, and the other convex. These flexures are made to operate in regulating valves, stop-cocks, stove-registers, &c. and thereby to regulate the flow of heated liquids, or the admission or emission of air.

The degree of tensile force applied is determined beforehand by trials on the same quality of metal at the ordinary temperature, in order to ascertain what force would, in that case, have been sufficient to break the piece which is to be submitted to thermo-tension.

This (thís), *a.* and *pron. pl.* **These** (théz), [A. Sax. masc. *thes*, fem. *theos*, neut. *thís*,

pl. *thās*, which in later times became *those*, *these* (O.E. also *thīse*) being rather formed as a separate plural by the adding of *e* to the singular. (See *THOSE*.) O.Sax. *these*, *thius*, *thit*, Icel. *thessi*, *thetta*, G. *dieser*, *diese*, *dieses*. *This* is composed of the pronominal stems *thā* (Skr. *tā*) (= *this*, *that*, *thither*, &c., and *se*, *sa*, he (=Skr. *sa*, he)) 1. A demonstrative used to denote something that is present or near in place or time, or something just mentioned; as, is *this* your younger brother? what trespass is *this* which ye have committed?

Who did *this*, *this* man or his parents, that he was born blind? Jn. ix. 2.

When they heard *this*, they were pricked in their heart. Ac. ii. 37.

In the latter passage *this* is a substitute for what had preceded, viz. the discourse of Peter just delivered. In like manner *this* often represents a word, a sentence, or clause, or a series of sentences or events. In some cases it refers to what is to be immediately related or done.

But know *this*, that if the Goodman of the house had known in what watch the thief would come, he would have watched, and would not have suffered his house to be broken up. Mat. xxiv. 43.

2. Applied to notions of time, *this* may refer to (a) the present time; now; as, *this* day. 'Between *this* and supper.' Shak. (b) Time past; the time immediately before the present time; as, I have taken no snuff for *this* month.

Nor need'st thou much importune me to that Whereon *this* month I have been hammering. Shak.

It is often used for *these*, the sum being reckoned up, as it were, in a total. 'This two and thirty years.' Shak.

I have not wept *this* forty years; but now Dryden. My mother comes afresh into my eyes.

The plural, however, is now more commonly used by writers in such cases (c) Time next to come. 'This night I'll waste in sorrow.' Shak.

I learn'd in Worcester as I rode along, He cannot draw his power *this* fourteen days. Shak.

In Shakspeare the phrases *this even* and *this night* occur, meaning *last even*, *last night*.—By *this*, by *this* time; as, by *this* the mail has arrived.

By *this* the vessel half her course had run. Dryden. *This* other day,† very lately; the other day.

You denied to fight with me *this* other day. Shak.

3. *This* is frequently used to signify present place, state, condition, position, or the like; as, *this* (state of matters) is rather unpleasant.

You shall leave *this* to-morrow. Trollope. Since he left *this*, . . . he never as much as bestowed a thought upon us. Leaver.

4. *This* is used as opposed or correlative to *that*. *This* refers to the nearest person or thing; *that* to the most distant. Frequently, however, *this* and *that* denote reference indefinitely.

Two ships from far making aim at us, Of Corinth *that* of Epidaurus *this*. Shak. *This* way and *that* the wav'ring sails they bend. Pope.

A body of *this* or *that* denomination is produced. Boyle.

When *this* and *that* refer to different things before expressed, *this* refers to the thing last mentioned, and *that* to the thing first mentioned. See *THESE*, *THAT*.

Their judgment in *this* we may not, and in *that* we need not follow. Hooker.

It is sometimes opposed to *other*.

Consider the arguments which the author had to write *this*, or to design the *other*, before you arraign him. Dryden.

Thistle (thist'l), *n.* [A. Sax. *thistel*, Icel. *thistill*, G. and D. *tiel*, Sw. *tistel*, Sc. *thistle*, thistle. Origin doubtful.] The common name of prickly plants of the tribe Cynaraceae, nat. order Composite. The genus *Carduus* with its sub-genera *Cirsium* or *Cnicus* and *Silybum* contains the greatest number of those commonly recognized. There are numerous species, most of which are inhabitants of Europe, as the musk-thistle (*Carduus nutans*), milk-thistle (*C. Marianus*), wetted thistle (*C. acanthoides*), slender-flowered thistle (*C. tenuiflorus*), the spear-thistle (*Cnicus lanceolatus*), and field thistle (*Cnicus arvensis*), a well-known plant, very troublesome to the farmer. The blessed-thistle (*Carduus benedictus*) of the pharmacopoeias, *Cnicus benedictus* or *Cirsium benedictum* of modern botanists, is a native of the Levant,

and is a laxative and tonic medicine. The name thistle is also given to numerous prickly plants belonging to other genera, as the cotton-thistle belongs to the genus *Onopordum*. The common cotton-thistle (*O. Acanthium*) attains a height of from 4 to 6 feet. It is often cultivated as the Scotch thistle, but it is doubtful whether the thistle which constitutes the national badge has any existing type, though the stemless thistle (*Cnicus acaulis* or *Cirsium acule*) is in many districts of Scotland looked on as the true Scotch thistle. The carline thistle belongs to the genus *Carlina*; the star-thistle is the *Centaurea Calcitrapa*. The sow-thistle belongs to the genus *Sonchus*, and the globe-thistle to the genus *Echinops*. Some species of the thistle are admitted into gardens, where they form a pretty variety for horders. Thistles sow themselves extensively by means of their winged seeds, and hence they are great pests to the farmer. The thistle seems to have been a national emblem in Scotland in the time of James III., and it was evidently well known as such when Dunbar wrote his poem of the 'Thistle and the Rose' (1503).—Order of the Thistle, a Scottish order of knighthood, sometimes called the order of St. Andrew. It was instituted by James VII. (James II. of England) in 1687, when

Order of the Thistle—Star, Jewel, Badge, and Collar.

eight knights were nominated. It fell into abeyance during the reign of William and Mary, but was revived by Queen Anne in 1703. The insignia of the order consist of a gold collar composed of thistles interlaced with sprigs of rue; the jewel, a figure of St. Andrew in the middle of a star of eight pointed rays, suspended from the collar; the star, of silver and eight-rayed, four of the rays being pointed, while the alternate rays are shaped like the tail-feathers of a bird, with a thistle in the centre surrounded by the Latin motto *Nemo me impune lacessit*; and the badge, oval, with the motto surrounding the figure of St. Andrew. The order consists of the sovereign and sixteen knights, besides extra knights (princes), and a dean, a secretary, the lion-king-at-arms, and the gentleman usher of the green rod.

This city is near . . . Oh let me escape *thither*. Gen. xix. 20. Where I am, *thither* ye cannot come. Jn. vii. 34.

Thither in this sense is now comparatively little used, especially in ordinary prose or in conversation, *there* having to a great extent taken its place. It is still used in elevated style, however, as also where *there* would be ambiguous.—2. Thrashing, **Threshing** (thrash'ing, thresh'ing), *n.* 1. The operation by which grain is separated from the straw. This operation is performed in various ways, as by the feet of animals, by a flail, or by a thrashing-machine. The first mode was that employed in the ages of antiquity, and it is still practised in the south of Europe, and in Persia and India. Oxen were generally employed for this purpose, either alone or with the addition of a kind of roller studded with iron knots, which the oxen dragged over the corn-sheaves, which latter were spread on a circular floor in the form of a circle, the ends containing the grain being placed towards the centre. Thrashing by the flail is still practised in various parts of this and other countries, but thrashing-machines have been very extensively introduced, which effect a great saving in time and labour to the farmer.—2. A sound drubbing.

Thrashing-floor (thrash'ing-flór), *n.* A floor or area on which grain is beaten out. In eastern countries, from the earliest ages, thrashing-floors were in the open air; but in colder and moister climates, such as ours, such floors must be under cover, as in a barn.

Thrashing-machine, **Thrashing-mill** (thrash'ing-má-shén, thrash'ing-míl), *n.* A machine for separating grain, as wheat,

oats, barley, &c., from the straw; and in which the moving power is that of horses, oxen, wind, water, or steam. The thrashing-machine was invented in Scotland in 1755 by Michael Stirling, a farmer in Perthshire; it was afterwards improved by Andrew

Section of Scotch Thrashing-machine.

Meikle, a millwright in East Lothian, about the year 1776. Since that time it has undergone various other improvements. The cut shows in section a machine of this kind as at present constructed. The principal feature is the three rotatory drums or cylinders, which receive motion from a water-wheel, or from horse or steam power. The first drum which comes into operation has projecting ribs called beaters on its outer surface, parallel to its axis. This drum receives a very rapid motion on its axis. The sheaves of corn are first spread out on a slanting table, and are then drawn in with the ears foremost between two feeding rollers with parallel grooves. The beaters of the drum act on the straw as it passes through the rollers, and beat out the grain. The thrashed straw is then carried forward to two successive drums or *shakers*, which, being armed with numerous spikes, lift up and shake the straw so as to free it entirely from the loose grain lodged in it. The grain is made to pass through a grating floor, and is generally conducted to a winnowing-machine connected by gearing with the thrashing-machine itself, by which means the grain is separated from the chaff. Improved machines on the same principle, many of them portable, are extensively used in England and America, those of the latter country being in particular very light and effective. The portable steam thrashing-machine now common in England and in many parts of Scotland has no feeding-rollers, the corn being fed direct to the first drum, which revolves at a very high speed and separates the grain by rubbing against a grating fitted around the drum rather than by direct beating. It gets through far more work than the ordinary stationary mill. With a portable engine the machine can be moved from field to field, and also from farm to farm, thus being capable of performing the thrashing-work of a wide district for the whole season. The owner, by hiring it out, can therefore soon recoup himself for the high price of this machine as compared with the fixed mill.

Fris. *thuner*, *G. donner*; cog. L. *tonitru*, Per. *tundur*; all from a root seen in A. The name *Thor*, Icel. *Thórr*, the Scandinavian god of thunder, is simply a form of this word.] 1. The sound which follows a flash of lightning; a report due to the sudden disturbance of the air produced by a violent discharge of atmospheric electricity or lightning. The character of the sound varies with the force and the distance of the discharge and the nature of the surrounding country, and is no doubt affected by the relative positions of the clouds. A person in the immediate neighbourhood of a flash of lightning hears only one sharp report, the sharpness being greatly intensified when an object is struck by it. A person at a distance hears the same report as a prolonged peal, and persons in situations at some distance apart hear it each in a different way. These differences have not yet been satisfactorily accounted for; the long rolling effect may be due to echoes from the clouds, and partly perhaps to there being a number of partial discharges from the same cloud at different distances from the observer. As sound travels at the rate of 1100 feet per second, while the passage of light is almost instantaneous, the distance of the observer from the discharge may be approximately estimated by dividing the interval in seconds between the flash and the report by 5 or 4.8, the product being the distance in miles to the place of discharge. Thunder has never been heard 20 miles from the flash. 2. The destructive agent in a thunder-storm; a discharge of lightning; a thunderbolt.

Thunderbolt (thun'dér-bólt), *n.* 1. A shaft of lightning; a brilliant stream of electricity passing from one part of the heavens to another, and particularly from the clouds to the earth. The terms *thunderbolt* and *thunderstone* were hence frequently applied to certain concrete substances found in the earth which superstition credited with such dreadful effects. (See *THUNDERSTONE*.) In *her*, the thunderbolt is repre-

The daphnes are valued for their fragrance; the various species of the Australian genus *Pimelea*, and the *Gnidias* and *Struthiolas* of the Cape of Good Hope, are favourite objects of cultivation. The most remarkable property of the order is the causticity which resides in the bark. When applied to the skin it acts as a blister; and when chewed it produces pain in the month. That it in golden letters should be set
Among the high *tides* in the calendar! *Shak.*

Tide was scrupulously used by the Puritans, in composition, instead of the Popish word *mass*, of which they had a nervous abhorrence. Thus for Christmas, Hallowmas, Lammas, they said *Christ-tide*, *Hallow-tide*, *Lamb-tide*. Luckily *Whit-tide* was rightly named to their hands. *Nares.*

2. The alternate rising and falling of the waters of the ocean, and of bays, rivers, &c., connected therewith. The tide appears as a general wave of water, which gradually elevates itself to a certain height, then as gradually sinks till its surface is about as much below the medium level as it was before above it. From that time the wave

again begins to rise; and this reciprocating motion of the waters continues constantly, with certain variations in the height and in the times of attaining the greatest degree of height and of depression. The alternate rising and falling of the tide-wave are observed to take place generally twice in the course of a lunar day, or of 24h. 49m. of mean solar time, on most of the shores of the ocean, and in the greater part of the bays, firths, and rivers which communicate freely with it. The tides form what are called a *flood* and an *ebb*, a *high* and *low* water. The whole interval between high and low water is often called a *tid*; the water is said to *flow* and to *ebb*; and the rising is called the *flood-tide*, and the falling the *ebb-tide*. The rise or fall of the waters, in regard to elevation or depression, is exceedingly different at different places, and is also variable everywhere. The interval between two succeeding high-waters is also variable. It is shortest about new and full moon, being then about 12h. 19m.; and about the time of the moon's quadratures it is 12h. 30m. But these intervals are somewhat different at different places. The chief cause of the tides is the attraction of the moon, which, affecting most strongly the side of the earth nearest to it, draws or heaps up the waters in the parts of the earth successively turned towards it. At the same time the moon attracts the bulk of the earth, and, as it were, pulls the earth away from the water on the surface farthest from it; so that here also the water is raised, although not quite so much as on the nearer side. The waters being thus heaped up at the same time in these two opposite parts of the earth, and the waters situated half-way between them being thus necessarily depressed, two *high* and two *low* tides occur in the period of a little more than one revolution of the earth on its axis. The accompanying cut gives a theoretical view of the effect of the moon's attraction. On the tidal wave caused by the

moon must be superposed that caused by the attraction of the sun, a wave of far inferior volume. When the sun and moon are in conjunction or opposition, at times of new and full moon, their tidal waves will be superposed crest upon crest, and the effect will be what is called a *spring-tide*; when they are in quadrature the lunar tide will be partially neutralized by the solar tide, and the result is a *neap-tide*. (See also *TIDE-WAVE*.) The above explanation assumes that the earth is spherical and uniformly covered with water, and the corrections to be made in consequence of the inaccuracy of these assumptions have occupied the attention of scientists since the time of Newton. The tides being of great importance to all commercial nations, it becomes an object of great importance to obtain the means of predicting them; but the subject, in a general point of view, is attended with many difficulties, and each place requires to have its own tide-tables. As much of the phenomena as depends on the attraction of the sun and moon is completely understood, and may in any, even unknown, part of the earth's surface, be foretold with certainty; and the far greater part of the phenomena depends on those causes. But circumstances of a local or casual nature, such as the configuration of the bottom of the ocean, the degree of confinement from shores, the direction of the wind, &c., influence, in many or in all places, the height and time of the tide. *J. Bengal Tiger (*Felis tigris*).

the genus *Felis*, *F. tigris* (sometimes classified as *Tigris regalis*), family *Felidae*. The tiger is about the height of the lion, but the body is longer, and the head rounder. It is of a lively fawn colour above, a pure white below, irregularly crossed with black stripes. It is clothed with short hairs, and has no mane. White or albino varieties have been occasionally met with, a specimen having been shown in this country in 1820. The tiger attains his full development in India, the name of Bengal tiger being used as synonymous with those specimens which appear as the most typical and most powerful representatives of the species. The animal is also found in Java and Sumatra, and no traces of it are found beyond Southern Asia. In habits the tiger is far more active and agile than the lion, and exhibits a large amount of fierce cunning. He generally pitches upon a concealed spot near a water course as a habitat, and springs upon the animals that approach to drink, slinking back to his lair as if discomfited and ashamed should his first bound be unsuccessful. His tread through the thick jungle is noiseless and stealthy, and he appears to avoid rather than court danger, unless when brought to bay, when he turns an appalling fierce front to the foe. These animals do not generally readily attack man himself, but in some cases they seem to acquire a special liking for human prey, and boldly approach villages for the purpose of securing it; such being known as 'man-eaters.' The natives destroy them by traps, pits, poisoned arrows, and other means. Tiger hunting is a favourite Indian sport. It is pursued generally by Europeans, the tiger being shot from the back of an elephant. When taken young the tiger can be tamed, and tigers thus domesticated are not rarely to be seen in India. The name American tiger is frequently applied to the jaguar (*Felis onca*) (See **JAGUAR**). Hence—2. A person of a fierce, bloodthirsty disposition.—3. Timber (tim'bér), *n.* [*A. Sax. timber*, timber, wood, framework, structure; *Icel. timbr*, timber, wood felled for building; *Dan. tømmer*, timber, a frame; *D. timmer*, an apartment; *getimmer*, timber-work; *O. H. G. zimbar*, wood, edifice; *Mod. G. zimner*, an apartment, *zimmerholz* (lit. timber-wood), timber, *zimmermann*, a carpenter. The oldest meaning seems to have been structure, edifice, as in *O. Sax. timbar*, *O. Fris. timbar*, an edifice, and as seen in the different verbs; *A. Sax. timbrian*, *Goth. timrian*, *Icel. timbra*, *Dan. tømre*, *G. zimern*, to build. The root is that of *Gr. demō*, to build, *domos*, *L. domus*, a house (whence *domestic*, *domicile*, &c.). Timber therefore means literally building materials.] 1. Trees cut down, squared, or capable of being squared into beams, rafters, boards, planks, &c., for being employed in house or ship building, or in carpentry, joinery, &c. (See *BATEX, DEAL, PLANK, LUMBER*.) Timber is generally sold by the load. A load of rough or unhewn timber is 40 cubic feet, and a load of squared timber 50 cubic feet, reckoned to weigh 20 cwt. In regard to planks, deals, &c., the load consists of so many square feet; thus a load of 1 inch plank is 600 square feet; a load of plank more than 1 inch thick equals 600 square feet divided by the thickness in inches. Wood is a general term, comprehending under it timber, dye-woods, fancy woods, fire-wood, &c., but the word *timber* is often used in a loose sense for all kinds of felled and seasoned wood.—2. A general term applied to growing trees yielding wood suitable for constructive purposes. Some of the Conifere yield valuable timber, as the different kinds of fir and pine. The great majority of trees valuable as timber, however, are tree exogens, as the oak, ash, elm, beech, sycamore, &c., among British trees, the chestnut and walnut among those of the South of Europe; and the mahogany, teak, &c., of tropical countries.

This peculiar quality in musical sounds is caused by the mingling of a series of secondary tones with the primary one; as, when the string of a pianoforte is struck, the string, whilst vibrating as a whole, is at the same time divided and again subdivided into aliquot vibrating segments, which, as it were, ride on the back of the principal vibration. The character and number of these secondary tones coexisting with the principal note is the cause of the *timbre* or quality of sound peculiar to different instruments.

Time (tim), *n.* [A Sax. *tima*, time, hour, season; Icel. *timi*, Sw. and Dan. *time*; not in the other Teutonic languages; origin doubtful. Probably of same stem as *tide*, and the root may be *dâ*, as in Skr. *dâ*, to cut, to divide (the *d* becoming *t* in accordance with Grimm's law), in which case *time* might be compared with *L. tempus*, so far as similarity of ideas is concerned, supposing the latter to be from root *tem*, to cut.] 1. The general idea of successive existence; the measure of duration. Time is *absolute* or *relative*; *absolute time* is considered without any relation to bodies or their motions. It is conceived by us as unbounded, continuous, homogeneous, unchangeable in the order of its parts, and divisible without end. *Relative time* is the sensible measure of any portion of duration, often marked by particular phenomena, as the apparent revolution of the celestial bodies, more especially of the sun, or the rotation of the earth on its axis. Time is divided into years, months, weeks, days, hours, minutes, and seconds; but of these portions the years and days only are marked by celestial phenomena. In order to measure time we employ some equable motion, and we judge those times to be equal which pass while a moving body proceeding with a uniform motion passes over equal spaces. The instruments employed for measuring time are clocks, chronometers, clepsydras, hour-glasses, and dials; but the three first are those chiefly used. Time is often poetically personified as masculine. 'The plain bald pate of father Time himself.' *Shak.*

Why grieve that *Time* has brought so soon
The sober age of manhood on?
As idly should I weep at noon
To see the blush of morning gone. *Bryant.*

12. In *music*, (a) the relative duration of a sound (or rest) as measured by the rhythmic proportions of the different notes, taking the semibreve (∞) as the unit or standard, the minim (♩) being half the semibreve, the

crotchet (♫) half the minim, the quaver (♯) half the crotchet, and so on. Thus, should a semibreve be sounded (say) 8 seconds of time, a minim would occupy 4 seconds, a crotchet 2, a quaver 1, and so on. (b) The style of movement or peculiarity of accent in a composition, such as is marked by the regular grouping of a certain and equal number of notes, or of more or less notes equal in time value to that certain number, through all the bars of a movement; the different combinations of sounds and values being said to constitute different kinds of time, each indicated by a different rhythmic or time signature. These measures or divisions are of several kinds, but may be all ranged in two classes, *duple* or *binary* time and *triple* or *ternary* time, the former being marked by two beats and the latter by three beats to the measure or bar. Notwithstanding a certain similarity these latter forms may not be connected with the Teutonic.] 1. At. wt. 118. *Sym. Sn.* A metal of a white brilliant colour, slightly tinged with gray. In hardness it is intermediate between gold and lead; it is very malleable, and may be beaten out into leaves less than the thousandth of an inch in thick-

ness. It is more tenacious than lead, and very flexible, and when bent in the fingers it emits a peculiar crackling sound. Its specific gravity is 7.29. It melts at 442°, and if heated to whiteness in air it takes fire and burns with a white flame, forming peroxide of tin. Tin is rather a scarce metal, being found in few places of the world in any quantity. The mines in Cornwall are its most productive source; it also occurs in Bohemia, Saxony, and Spain; in the islands of Banca and Ilditon, and the Straits Settlements, in Asia; in Mexico, Chili, Peru, and Massachusetts, in America; and in Australia. There are only two ores of tin: the native binoxide, called *tin-stone*, and the double sulphide of tin and copper, called *tin pyrites*. The binoxide of tin, called also *cassiterite*, is the only one found in sufficient quantities to make it the object of mineral explorations. It occurs in Cornwall in two forms: (1) in veins where it is blended with several other metals, as arsenic, copper, zinc, and tungsten; (2) in loose rounded masses, grains, or sand in alluvial soil, in which state it is called *stream-tin*. The former, when reduced to the metallic state, yields black-tin, while the latter yields grain-tin, which is the purer of the two. What is termed wood-tin is found in reniform and botryoidal masses, or in wedge-shaped pieces. Tin pyrites, the other ore of tin, occurs massive, with a granular composition; fracture uneven, imperfectly conchoidal; lustre metallic; colour steel-gray, inclining to yellow; hardness about that of fluor-spar. It contains from 14 to 30 per cent of tin. The Phœnicians, long before the Christian era, fetched this metal, under the name of *kassiteros*, from the British islands, which were thence called *Cassiterides*, or islands of tin. Oxygen combines with tin, forming protoxide of tin or stannous oxide (SnO), sesquioxide (Sn_2O_3), and dioxide or stannic oxide (SnO_2). The compounds of chlorine with tin are dichloride or stannous chloride (SnCl_2), sesquichloride or stannoso-stannic chloride (Sn_2Cl_3), and tetrachloride or stannic chloride (SnCl_4); and of sulphur with tin, the protosulphide or stannous sulphide (SnS), sesquisulphide (Sn_2S_3), and the disulphide or stannic sulphide (SnS_2). The uses of tin are numerous. It is much used as a covering to several other metals, as in tin-plate and cooking vessels of copper. Combined with copper it forms bronze, bell-metal, and several other useful alloys. With lead it forms pewter, and solder of various kinds. Tin-foil coated with mercury forms the reflecting surface of glass-mirrors. The solutions of tin in the nitric, muriatic, nitro-sulphuric, and tartaric acids are much used in dyeing. 2. 2. In animal anat. the texture or grouping of anatomical elements of which the systems of organs are composed; the primary layers composing any of the parts of animal bodies. The classification of tissues may now be said to be arranged on two different principles, having reference either to special histology, which concerns itself with the structure of organs in which a combination of various tissues may enter; or to general histology, which treats of the tissues properly so called. Hence, under the first arrangement we speak of *muscular tissue*, or *flesh*; *osseous tissue*, or *bone*; *adipose tissue*, or *fat*; *cartilaginous tissue*, or *gristle*; *pigmentary tissue*, or *colouring matter* seen in the skin, in the choroid coat of the eye, the iris, &c.; *areolar, cellular, or connective tissue*, widely distributed in every part of the body, and serving to bind together and consolidate other parts and tissues. According to the second system of grouping we have, (a) *cellular tissue*, which consists entirely of cells, in which cell lies close to cell, such as occur in the epidermis, nails, the epithelium, or living membranes of the inner surfaces of the body, &c.; (b) *connective tissue*, in which one cell is regularly separated from the others by a certain amount of intermediate or intercellular substance, as exemplified in cartilage, fat, &c.; (c) more highly developed tissues in which the structures are usually more or less tubular; this group including the muscles, nerves, and vessels, and, in Virchow's arrangement, the blood. It is to be observed that though the terms in the two classifications may have a correspondence in name, the correspondence does not extend strictly to the nature of the tissues to which they are applied. The terms *adventitious, accidental, or pathological tissue* have been applied generally to morbid productions resembling any of the natural or physiological tissues. The belief is gaining currency that every pathological tissue has its physiological or normal prototype, and that the abnormality consists either in its production at the wrong place or time, or to an excessive extent.—3. In vegetable anat. the minute elementary structures of which the organs of plants are composed. These elementary structures differ from each other, and are so minute as generally to be distinctly visible only with the aid of the microscope. They are named *elementary organs, organic tissue*, or

vegetable tissue. When a leaf or a portion of the stem of one of the higher plants is submitted to the microscope it is found to consist, (1) of a thin transparent homogeneous membrane, which is arranged in the form of cells or cylindrical tubes; (2) of fibres which are arranged in a spiral form in the interior of the cells or tubes; and (3) of a fluid, filling the cells, and existing between them, and containing in it globules of various sizes and kinds. These parts constitute what are known respectively as elementary membrane, elementary fibre, and organic mucus. The elementary fibre is only found in the higher forms of plants, the other two are found in all plants. The tissues of plants then are composed of elementary membrane and elementary fibre, and the principal forms under which they

exhibit themselves constitute the cellular tissue, fibrous tissue, and vascular tissue. *Cellular tissue*, often called *parenchyma*, is composed of membrane in the form of cells or cavities which are closed on all sides, and are commonly of a spheroidal form, although they often assume various other forms. The pith of plants is entirely composed of cellular tissue, but it enters largely into the structure of other parts, and in many, as in the mushroom and sea-weed orders, is the only tissue. *Fibrous tissue* is that in which the elementary fibre alone is apparent. When the cells are composed of membrane and spiral fibre combined, or of fibre alone (as in some instance when the membrane appears to have been absorbed during growth), they constitute the *fibro-cellular tissue*. *Vascular or tubular tissue* is composed of very elongated membranous tubes, tapering at each end. It comprehends the woody (also called *prosenchyma*) and laticiferous tissues. When the tubes have within them a spiral fibre, or their walls marked with broken spiral lines or dots, arranged in a circular or spiral direction, they constitute *fibro-vascular tissue*.—4. Titania (tī-tā'nī-a), *n.* The queen of Fairyland and consort of Oberon.

The Shakespearean commentators have not thought fit to inform us why the poet designates the Fairy-queen *Titania*. It, however, presents no difficulty. It was the belief of those days that the Fairies were the same as the classic Nymphs, the attendants of Diana. . . . The fairy-queen was therefore the same as Diana, whom Ovid (Met. iii. 173) styles *Titania*. Keightley.

Titanium (tī-tā'nī-um), *n.* [So called in fanciful allusion to the Titans. See TITAN.] Sym. Ti. At. wt. 50. A metal discovered by Gregor in 1791, in a black sand in Cornwall. It was afterwards discovered by Klaproth in some other minerals, and he gave it the name it now bears. In 1822 Wollaston examined it, and ascertained its properties. It is found combined with oxygen in several minerals, and occurs occasionally in combination with nitrogen in the slag ironworks as small cubical crystals, exactly similar to bright copper in appearance, of specific gravity 5.3, and very infusible. When heated with nitre these crystals are oxidized, producing titanic acid. Titanium is a dark green, heavy, amorphous powder. Oxygen and titanium combine, forming the sesquioxide Ti₂O₃, which is a black powder, and the peroxide or titanic acid, TiO₂. Titanium also combines with chlorine, forming two chlorides, TiCl₃ and TiCl₄, and with sulphur forming a sulphide, TiS₂. This metal forms several compounds with nitrogen. The ores of this metal are called menachanite, from Menachan in Cornwall, where it was originally found; iserine, from the river Iser, in Silesia; nigrine, from its black colour; sphene, rutile, brookite, axotomous iron, chertomite, ilmenite, moshiite, æschynite, greenovite, and octahedrite or anatase.—*Titanium green*, ferrocyanide of titanium, precipitated by ferrocyanide of potassium from a solution of titanic chloride, recommended as an innocuous substitute for Schweinfurt-green and other arsenical green pigments. In England tithes are *personal*, *predial*, or *mixed*; *personal*, when accruing from labour, art, trade, and navigation; *predial*, when issuing from the earth, as hay, wood, grain, and fruit; and *mixed*, when accruing from beasts which are fed from the ground. Another division of tithes is into *great* and *small*. *Great* tithes consist of all species of corn and grain, hay, and wood; and *small* tithes, of predial tithes of other kinds, together with mixed and personal tithes. The great tithes belong to the rector, and are hence called *parsonage tithes*; and the latter are due to the vicar, and are hence called *vicarage tithes*. Tithes are either due de jure or by custom; to the latter class belong all personal tithes. The exemptions from tithes are composition, a *modus decimandi*, prescription, or act of parliament.—*Commutation of tithes*, the conversion of tithes into a rent-charge payable in money, and chargeable on the land. Several acts of parliament have been passed for effecting the commutation of tithes in England and Ireland. In regard to tithes in Scotland see *TEINDS*.—2. A small part or proportion.

The five orders of nobility in Britain are distinguished by the titles of honour—Duke, Marquess, Earl, Viscount, and Baron; and the persons in whom the dignity of the peerage inheres are entitled to be designated by these words. The dignity of Baronet has, besides its name, which is placed after the name and surname of the person spoken of, the privilege of prefixing *Sir*. This title, like the titles of peers, is hereditary. The dignity of knighthood, which is not hereditary, entitles those on whom the honour is conferred to the prefix *Sir* to their former name and surname. Ecclesiastical dignities, such as Archbishop, Bishop, &c., bring with them the right to certain titles of honour besides the phrases by which the dignity itself is designated; and it is usual to bestow on all persons who are admitted into the clerical order the title of Reverend. Municipal offices have

also titles accompanying them, as the Right Honourable the Lord Mayor, the Right Honourable the Lord Provost, the Lord Dean of Guild, &c.; and in the law there are very eminent offices the names of which become titles of honour to the possessors of them, and which bring with them the right to certain terms of distinction.

15. The sign of the infinitive mood of a verb, or governing the gerundial infinitive or gerund. The simple infinitive occurs in such sentences as, I wish to go, command him to go, to ride is pleasant.

Ay, but to die, and (to) go we know not where;
To lie in cold obstruction and to rot;
This sensible warm motion to become
A kneaded clod. *Shak.*

It is generally omitted after the auxiliaries *do*, *can*, *may*, *must*, *will*, *shall* (with their past tenses), as well as after such verbs as *bid*, *dare*, *need*, *make*, *see*, *hear*, *feel*, *let*, *perceive*, *behold*, *observe*, *have* (in such phrases as *I would have you know* = *I would wish you to know*), and *know*. (To speak more correctly to is not omitted in these cases, but the old infinitive without *to* is used. Formerly it was sometimes inserted; as, 'Many did to die.' *Spenser*.) The gerundial infinitive denotes design or purpose, and in this case the form *for to* was formerly in good usage; as, 'What went ye out for to see?' *Mat. xi. 9*; but this is now inelegant and vulgar. — *To* with the gerundial infinitive often comes (a) after an adjective; as, prompt to obey; quick to hear; slow to censure.

We are ready to try our fortunes to the last man. *Shak.*

(b) After the substantive verb, to denoting futurity. 'We are still to seek for something else.' *Bentley*. (c) After *have*, to denoting duty or necessity; as, I have a debt to pay. — Anciently *to* was often omitted where we should now insert it as a sign of the infinitive.

Being mechanical, you ought not [to] walk
Upon a labouring day without the sign
Of your profession. *Shak.*

It is often improperly so omitted in the present day. In colloquial usage to often stands for and supplies an infinitive already mentioned; as, he commands me to go with him, but I do not wish to.

Your grandfather would never let me travel; I wanted to, but he never would. *Disraeli.*

word.] The common name of the amphibian vertebrates belonging to the genus *Bufo*, now constituted into a family, Bufonidae. Toads have a thick, bulky body, covered with warts or papillae: a thick lump behind the ears, pierced with pores, from which issues a milky and fetid fluid. They have no teeth; the hind feet are but slightly webbed. They leap badly, and generally avoid the water. Some of them are hideous and disgusting animals, and the bite, saliva, &c., of the common toad were formerly considered poisonous. The toad is extremely tenacious of life, but experiments have conclusively shown that there is no truth in the oft-repeated stories of the creature being able to support life when inclosed in solid rock for immense periods of time. Toads are found in all quarters of the world. The common toad (*Bufo vulgaris*) and green toad (*B. viridis*) inhabit not only Europe, but also Asia and Africa. Toads are most abundant in America. [The word literally designates a person who would do the most disgusting acts at the bidding of a superior, the eating of a toad being one of the most nauseous that can be conceived. There was in the place a gay fellow, half-fuddled, who offered to jump in, and swore, 'tho' he liked not the liquor, he would have the toast (making an allusion to the usage of the times of drinking with a toast at the bottom of the glass). 'Tho' he was opposed in his resolution, this whig gave foundation to the present honour which is done to the lady we mention in our liquors, who has ever since been called a toast. *Tatler*.

3. Any one who is named in honour in drinking, as a public character or a private friend; any thing honoured in a similar manner; a sentiment proposed for general acceptance in drinking.

Tobacco (tô-bak'kô), *n.* [Perhaps from *Tabaco*, a province of Yucatan, in Spanish America, where it is said to have been first found by the Spaniards. But this is very doubtful. Las Casas says that in the first voyage of Columbus the Spaniards saw in Cuba many persons smoking dry herbs or

leaves rolled up in tubes called *tabacos*. Charlevoix, in his *History of St. Dominique*, says that the instrument used in smoking was called *tabaco*, and hence the name, and Humboldt adopts this view. In Hakluyt's *Voyages*, 1589, it is stated that 'there is an herbe (in Virginia) which is sowed apart by itself, and is called by the inhabitants *upvooce*: in the West Indies it hath divers names, according to the several places and countries where it groweth and is used. The Spaniards call it *tabacco*.' A genus of plants (Nicotiana), mostly herbaceous, but some shrubby, nat. order Solanaceæ, natives of the

Virginia Tobacco (*Nicotiana glauca*).

warmer parts of America, Eastern Asia, and Australia. There are several species, all narcotic. Those most generally cultivated are *N. Tabacum* and *N. macrophylla*, the former being often called Virginian tobacco. It is of an erect habit, and grows to the height of 5 or 6 feet, having lanceolate leaves from 6 to 18 inches long, and rose-coloured flowers. Besides being used as the name of the plants *to-bacco* is also the name of the prepared leaves. Tobacco has been employed in medicine as a stimulant, emetic, and purgative, but it is as a luxury that its use is so widely diffused, the chief modes in which it is taken being smoking, snuffing, and chewing. The leaf undergoes various processes of manufacture in accordance with the mode in which it is to be used. Its use in America is of unknown antiquity. Among the North American Indians smoking has from time immemorial been regarded almost as a religious rite, the calumet being associated with their most solemn and important transactions. Meyen states that its use in China is also of high antiquity. It was first introduced into Europe in 1559 by Hernandez de Toledo, who brought a small quantity from America into Spain and Portugal. Thence its use forthwith spread into France and Italy, its first employment in these countries being in the form of snuff. Sir F. Drake introduced it into England in 1585, where tobacco taverns became nearly as prevalent as beer-shops. Its use was opposed strongly by both priests and rulers. Popes Urban VIII. and Innocent IX. issued bulls excommunicating such as used snuff in church, and in Turkey smoking was made a capital offence. In the canton of Berne the prohibition of the use of tobacco was put among the ten commandments immediately after that forbidding adultery. The *Counterblast* of James I. of England is matter of history. All prohibitions, however, regal or priestly, were of no avail, and tobacco is now the most extensively used luxury on the face of the globe. The most commonly used tobacco, and possibly the most esteemed, is the Virginian, but fine species or varieties are grown also in Cuba, Persia, and elsewhere. See NICOTIANA.—*Indian tobacco* (*Lobelia inflata*), a plant cultivated in the United States. It is used in medicine as an expectorant and diaphoretic, but it must be administered in small doses, as it is very poisonous.—*Mountain tobacco* (*Arnica montana*) grows in alpine meadows. Tokens were at one time struck by the corporations of Bristol, Oxford, and Worcester. A currency of this kind (mostly of copper) was much used during the close of last century; and previous to 1817, when there was a scarcity of government silver money, the Bank of England issued silver pieces called bank tokens of the values of 6s., 3s., and 1s. 6d. Toleration is of two kinds; the allowing to dissenters the unmolested profession and exercise of their religion, but with an exclusion from offices of trust and emolument in the state, which is a partial toleration; and the admitting them without distinction to all the civil privileges and capacities of other citizens, which is a complete toleration. *Paley.*

So natural to mankind is intolerance in whatever

they really care about, that in the minds of almost all religious persons, even in the most tolerant countries, the duty of toleration is admitted with tacit reserves. One person will bear with dissent in matters of Church government, but not of dogma; another can tolerate anybody short of a Papist or a Unitarian; another, every one who believes in revealed religion; a few extend their charity a little further, but stop at the belief in a God and in a future state. Wherever the sentiment of the majority is still genuine and intense, it is found to have abated little of its claim to be obeyed. *J. S. Mill.*

This act has been frequently amended and extended, and several other acts in the direction of toleration have been subsequently passed, so that now dissenters, Roman Catholics, and Jews alike enjoy all the privileges of the constitution.

4. In music, (a) the impression on the ear made by the undulations of the atmosphere, &c., produced by the vibration of a string or other sonorous body; a musical sound. Nearly every musical sound is composite, that is, consists of several simultaneous tones having different rates of vibration according to fixed laws, which depend on the nature of the sonorous body and the mode of producing its vibrations. The simultaneously sounding components are called *partial tones*; that one having the lowest rate of vibration and the loudest sound is termed the *prime*, *principal*, or *fundamental tone*; the other partial tones are called *harmonics* or *overtones*. Thus a single string produces not only its own prime or fundamental tone, but also its octave, twelfth, fifteenth (double octave), seventeenth, nineteenth, &c., or the sounds belonging to $\frac{1}{2}, \frac{1}{3}, \frac{1}{4}, \frac{1}{5}, \frac{1}{6}, \frac{1}{7}, \frac{1}{8}, \frac{1}{9}, \frac{1}{10}, \frac{1}{11}, \frac{1}{12}$, &c., of its length. Put in somewhat different and simpler words, the fundamental tone may be said to generate the other two tones of the major triad or common chord; that is, the third and the fifth, or their octaves, itself being the tonic or key-note. The quality of any sound (=timbre) is due partly to the presence or absence of overtones or harmonics in this series, and partly to the greater or less intensity of those present as compared with the fundamental tone and with one another; sounds composed of the above six elementary tones being rich and sweet. Under certain conditions it is found that two notes when sounded together produce by their combination other notes, which are not found as constituents of either; these are called *resultant tones*, and are of two kinds: *difference tones* and *summation tones*. A difference tone has a frequency of vibration which is the difference of the frequencies of its components; a summation tone has a frequency of vibration which is the sum of the frequencies of its components. As the components may either be fundamental tones or overtones, two notes which are rich in harmonics yield by their combination a large number of resultant tones. The difference tones were observed in the last century by Tartini, and have been therefore called *Tartini tones*. (b) One of the larger intervals between certain contiguous notes of the diatonic scale; as, the *major tones*, or intervals of 9 commas between C-D, F-G, and A-B; the *minor tones*, or intervals of 8 commas between D-E and G-A. The smaller intervals of 5 commas between E-F and B-C are called *semitones*. The terms *tone* and *semitone* are also applied to the artificial intervals adopted in the temperament of fixed-toned instruments. (See **TEMPERAMENT**.) (c) The peculiar quality of sound of any voice or instrument; timbre; as, a mellow or rich tone; a poor or thin tone; a ready tone. [Note. The regrettable use of the word *tone* both for a sound, and for the interval between two sounds or tones, is confusing, but has been hitherto common, indeed almost universal, among musicians of the highest standing.]—5. That state of a body in which the animal functions are healthy and performed with due vigour; the state in which all the parts and organs have due tension or are well-strung; the strength and activity of the organs, from which proceed healthy functions.—6. the leading features of which are as follows: As of the two relations of musical sounds, those of pitch and key, the latter is of transcendent importance, every means should be taken to impress this fact on the mind and ear of the learner. Any diatonic scale is a natural scale, whether it is founded on the key of C, D, E, or on any other tone thus represented by a letter-name in the ordinary notation. The tonic or key-note of the scale is always called *doh*, the second *ray*, the others *me*, *fah*, *soh*, *lah*, *te*, successively, no matter what the absolute pitch of the sound may be, the initials only being ordinarily used in printed music: thus, *d, r, m, f, s, l, t*. To designate a sound of absolute pitch, the tonic-solfaist uses the first seven letters of the alphabet just as the followers of the other musical system do. Time and accent are marked thus, | : |, or | : : |, or | : : : |, &c.; the space between the lines and dots indicating the aliquot parts of the bar (the beat or pulse), the line showing the strong accent, the short line the medium accent, and the colon the weak accent. Accidental or chromatic tones are indicated by a change in the vowel sounds of the syllables; thus, *doh*, *ray*, *fah*, &c., when sharpened become *de*, *re*, *fe*, &c., and *me*, *te*, &c., flattened become *ma*, *ta*, &c. The higher octaves are marked *d', r', m', &c.*, the lower *d, r, m, &c.* The last two lines of the psalm tune *French* would therefore be printed thus:—

Key F. : s | d' : t | l : s | s : fe | s
: m | r : d | d : t, | d.

In teaching the system great use is made of the modulator, a chart which represents pictorially in an upright position the relative places of the notes of the scales, the chromatic notes, the closely related scales, &c.

Tonnage (tun'aj), *n.* [From ton.] 1. The weight of goods carried in a boat or ship.—2. The cubical content or burden of a ship in tons; the number of tons a ship can

carry with safety; the gauge of a vessel's dimensions, estimated by various modes of measurement legalized in different countries. It is generally assumed that 40 cubic feet shall constitute a ton, and the tonnage of a ship is considered to be the multiple of this ton which most closely corresponds with the internal capacity of the vessel. In this country the usual mode formerly was to multiply the length of the ship by the breadth, assume the depth to be the same as the width, multiply by this assumed depth, and divide the product by 94, the quotient being the tons burden. But this mode was found to be both misleading and dangerous; for as harbour and light dues, towage, &c., were charged according to tonnage, shipowners had their vessels built so deep and narrow that they were often unseaworthy. An improved system was, therefore, introduced and made compulsory by the Merchant Shipping Act of 1854. The elaborate instructions of this statute take into account not only the depth of the vessel, but also make allowance for the varying curvature of the hull. The depth from the deck to the bottom of the hold is taken at different places, and the breadth is measured at different elevations in the depth. If the vessel is a steamer, an allowance is made for the space occupied by the engine-room, boilers, coal-bunks, &c. In vessels with a break or poop in the upper deck, the tonnage of this poop space must be ascertained and added to the ordinary tonnage.—3. A duty or impost on ships, formerly estimated at so much per ton of freight, but now proportioned to the registered size of the vessels.—4. —*Implement*, *Instrument*, *Tool*. An implement is whatever may supply a want or a requisite to an end, and is always restricted to physical use. A *tool* differs from an *implement*, which is always regarded in reference to its particular purpose, in being more general or less specific, and from an *instrument* in being always used in reference to the manual arts. Torpedo (tor-pē'dō), *n. pl.* **Torpedoes** (tor-pē'dōz), [*L.* from *torpeo*, to be stiff, numb, or torpid.] 1. An elasmobranchiate fish, allied to the rays, forming the type of the family *Torpedinidae*, which are noted for their power of discharging electric shocks

in the Mediterranean (including the common torpedo or *Torpedo vulgaris*, and *T. narke*) and in the Indian and Pacific Oceans, stray specimens being now and again found on the British coasts. The fish may sometimes measure 4 feet long, and weigh from 60 to 70 lbs. It owes its remarkable electric power to two special organs, which consist of two masses placed on each side of the head, and consisting each of numerous vertical gelatinous columns, separated by membranous septa, and richly furnished with nervous filaments derived from the nervi vagi, or eighth pair of nerves, the entire apparatus presenting a resemblance to the voltaic battery. The production of electricity by these fishes is readily enough explicable, on the ground of the conversion of an equivalent of nerve force into electric force through the medium of the electric organ; just as, under other circumstances, nerve force is converted into motion through the muscles. The power of the discharge varies with the health and size of the fish; but there is little doubt of the exceedingly potent nature of the apparatus, especially under excitement. The numbing power of the torpedo was well known to the Greeks and Romans. It also receives the names of *Cramp-fish* and *Numbing-fish*.

The torpedo, or cramp-fish, came to hand; a fish, if Pliny writes truth, that by hiding itself with mud and dirt catches lesser fish very strangely; for, by his fragility he benumbs such fish as swim over or lodge near him, and so preys upon them.

Sir T. Herbert.

2. A term applied to two distinct classes of submarine destructive agents used in war, namely, torpedoes proper, which are propelled against an enemy's ship; and more or less stationary chambers or mines, placed where a hostile vessel would be likely to come in contact with them. Of the first class, called also *offensive torpedoes*, there are three principal types: (a) the 'locomotive,' of which the Whitehead is the best known form; (b) the 'towing' torpedo of Captain Harvey; and (c) the 'spar' or 'outrigger' torpedo. The Whitehead, or fish torpedo, may be described as being a cigar-shaped vessel, varying from 14 to 19 feet in length, and from 14 to 16 inches in diameter. It is

made of specially prepared steel, and is divided into three compartments; the head contains the gun-cotton which forms its charge and the fuse for exploding it when it comes in contact with a vessel. The central part contains the engines by which it is propelled, and which are worked by compressed air, a sufficient supply of which for driving the torpedo the required distance is stored in the third, or tail compartment. The propeller is a three-bladed screw, which can move the largest sized torpedoes at a speed of 24 knots for the distance of 220 yards, the distance of 1000 yards being reached at a slower rate of progress. By means of a horizontal balance rudder it can be made to sink and to remain during its run at any required distance below the surface of the water, so that it may be discharged from the deck of a ship or from a tube opening into the sea below the water line. At close quarters this is a very destructive weapon against ironclad vessels, striking them beneath their armour. The Harvey torpedo is constructed to be pulled through the water something in the fashion of a ship's log. It is of such a form as to pull the line out at a considerable angle to the keel of the towing vessel, which endeavours to manœuvre so as to draw the torpedo under the stern of an enemy, and explode it on contact by a trigger bolt. The spar or outrigger torpedo consists simply of a metal case containing the explosive substance (gunpowder, gun-cotton, dynamite, &c.), and fitted with a fuse constructed so that it can be fired at pleasure, or exploded by contact with a ship's side. It is screwed on to a long spar, which is usually fixed in the bow of a swift boat or steam-launch, which endeavours to reach and push the

torpedo against the hostile vessel. Stationary or defensive torpedoes, such as one placed in channels or coasts to prevent the approach of the enemy's vessels, usually consist of a strong metal case containing an effective explosive, such as gun-cotton, &c., and having a fuse or cap which will explode the charge on the slightest contact; or the explosion may be effected by means of electricity, the operator firing it at will from the shore. — 3. A name sometimes applied to various other explosive agents, such as a shell buried in the path of a storming party, having a percussion or friction device which explodes the charge when the ground over the torpedo is trod on; a fog-signal laid on the metals of a railway and exploded by the wheels of a passing train; a kind of fire-work or toy in the shape of a small ball, which explodes on being dashed against a hard object.

This experiment consisted in filling with mercury a glass tube closed at one end and then inverting it; the open end was then brought under the surface of mercury in a vessel, when the column of mercury in the tube was observed to descend till it stood at a height equal to about 30 inches above the level of the mercury in the vessel, leaving a vacuum at the top, between the upper extremity of the column and that of the tube. This experiment led to the discovery that the column of mercury in the tube is supported by the pressure of the atmosphere acting on the surface of the mercury in the vessel, and that this column is an exact counterbalance to the atmospheric pressure. See *BAROMETER*.—*Toricellian tube*, a glass tube 30 or more inches in length, open at one end and hermetically sealed at the other, such as is used in the barometer.—*Toricellian vacuum*, a vacuum such as that produced by filling a barometer tube with mercury, as in the Toricellian experiment; the vacuum above the mercurial column in the barometer.

Torsion (tor'shon), *n.* [*L. L. torsio*, from *L. torqueo*, to twist. See *TORTURE*.] 1. The act of twisting; the twisting, wrenching, or straining of a body by the exertion of a lateral force tending to turn one end or part of it about a longitudinal axis, while the other is held fast or twisted in an opposite direction.—2. In *mech.* the force with which a body, such as a thread, wire, or slender rod resists a twist, or the force with which it tends to return to its original state on being twisted. The resistance which cylinders and prisms formed of different substances oppose to torsion, furnishes one of the usual methods of determining the strength of materials. Such machines as capstans and windlasses, also axles which revolve with their wheels, are, when in action, subject to be twisted, or undergo the strain of torsion. If a slender rod of metal be suspended vertically, so as to be rigidly fixed at the point of suspension, and then twisted through a certain angle, it will, when the twisting force ceases to act, untwist itself or return in the opposite direction with a greater or less force or velocity until it come to rest in its original position. The limits of torsion within which the body will return to its original state depend upon its elasticity, and the force with which it tends to recover its natural state is called *elasticity of torsion*. This force is always proportional to the angle through which the body has been twisted. If a body is twisted so as to exceed the limit of its elasticity, its particles will either be wrenched asunder, or it will take a *set*, and will not return to its original position on the withdrawal of the twisting force.—*Torsion balance*, or *balance of torsion*.

If a piece of very fine wire, silk, or spun glass be suspended in the manner above stated, and then twisted, it will, when released, begin to untwist itself, and by the momentum acquired in the act of untwisting will twist in the opposite direction to a greater or less extent, according to the amount of twisting to which it has been subjected. It will then begin to return, and thus by a series of oscillations, continually diminishing in extent, it will at length gradually settle in its original position. Now if a needle or an index be attached to the lower extremity of the suspended wire or thread, and a graduated circle be placed immediately beneath the index in a horizontal position, so that the centre of the circle may be directly below the point of suspension of the index, the apparatus thus constructed will form the *torsion balance*. This balance has been employed to measure certain forces too minute to be estimated by the ordinary methods, and by means of it Coulomb was enabled to determine, by direct experiment, the laws which govern the variation of magnetic and electric forces. By means of the same instrument Cavendish afterward detected and measured the attraction of gravitation existing between balls of lead. To measure small forces, such as those of electricity, magnetism, &c., with the torsion balance, they are made to act upon one extremity of the index, and thus cause it to turn round, and when the force is in equilibrium with the tendency of the suspended wire to untwist, the angle which the index makes with its original position, which is called the *angle of torsion*, and which is measured by the graduated circle, is the measure of the force employed. In making experiments with the torsion balance the length of the suspended wire, its diameter, and the weights attached to its lower extremity must be taken into account. When the balance is adapted to measure electric forces it is called the *torsion electrometer*, when it is adapted to measure galvanic forces it is called the *torsion galvanometer*, and when applied to measure magnetic forces it receives the name of the *torsion magnetometer*.—3. In *surg.* the twisting of the cut end of a small artery in a wound or after an operation, for the purpose of checking hæmorrhage. The bleeding vessel is seized by a forceps, drawn out for about $\frac{1}{2}$ inch, and then twisted round several times till it cannot untwist itself.

Fr. *tortue*, a tortoise, from *L. torquere*, *tortum*, to twist, to wrench, to wind (whence *torture*, &c.).] The name is given from the twisted appearance of the animal's limbs.] 1. The name which,

Common or Greek Tortoise (*Testudo graeca*).

when standing alone, is now generally restricted to the family of reptiles Testudinidae, or land-tortoises, or with a qualifying term is applied to the Emydidae, the terrapins or freshwater tortoises, and the Trionyxidae, the mud-turtles, or soft tortoises. The name was often formerly applied to all the members of the order Chelonina, which includes the Chelonidae, a salt-water family; but the reptiles of this section are now usually called turtles. (See *TERRAPIN*, *TURTLE*.) The distinctive features of the tortoises and other chelonians consist in the modification of the skeleton and of the skin structures or scales to form the well-known bony box in which their bodies are inclosed. Thus the spinal elements of the back, together with the expanded and united ribs, form the carapace or back, whilst the sides of the box are formed by marginal plates, which by some zoologists are regarded as representing the ossified and modified cartilages of the ribs, and by others as membrane bones developed by the skin. The plastron or lower part of the bony case is formed by nine pieces, as to the nature of which naturalists also disagree, some considering it merely as a greatly modified sternum or breast-bone, and others as composed of membrane bones developed like the marginal plates by the skin. The Testudinidae (the typical land-tortoises) have short stunted limbs adapted for terrestrial progression; the short toes are bound together by the skin, and have well-developed nails. The carapace is strongly convex, and is covered by horny

epidermic plates. The horny jaws are unprotected and adapted for cutting, or may be divided into serrated processes. The head, limbs, and tail can be completely retracted within the carapace. Though capable of swimming, the tortoises proper are really terrestrial animals, and are strictly vegetable feeders. The most familiar example is the common Greek or European tortoise (*Testudo graeca*) so frequently kept as a household pet, and which occurs chiefly on the eastern borders of the Mediterranean. These animals sometimes live to a great age (over 100 years according to some), and hibernate through the colder season of the year. They attain a length of 12 inches. A much larger species is the great Indian tortoise (*T. indica*), which inhabits in great numbers the Seychelles and Galapagos Islands, and attains a length of over 3 feet, and a weight of 200 lbs. Its flesh is reckoned food of excellent quality, as are also its eggs. The box tortoise of India and Madagascar (*Cingxis arachnoidea*) is remarkable for the curious development of the front part of the plastron which shuts over the anterior aperture of the shell like a lid when the animal retracts itself. The box tortoise of North America (*Cistudo carolina*), in which the hinder part of the plastron forms a lid, is included among the Emydæ or terrapins, as is also the lettered tortoise (*Emys scripta*) belonging to the same continent, and so named from the curious markings of its shell.—2. *Milit.* a defence used by the ancients, formed by the troops arranging themselves in close order and placing their bucklers over their heads, making a cover resembling a tortoise-shell; a testudo (which see).

Tortoise-beetle (tor'tois-bē-lī or tor'tiz-bē-lī), *n.* A member of an extensive family of coleopterous insects (Cassididae), living upon plants, and so called from their elytra projecting over the body somewhat like the carapace of a tortoise. Many hundred species are known, a few of which are found in this country.

It is a native of the Cape of Good Hope, and is occasionally found in greenhouses in Britain.

Tortoise-shell (tor'tois-shel or tor'tiz-shel), *n.* A name popularly applied to the shell or rather the scutes or scales of the tortoise and other allied chelonians, especially to the shell of the *Chelonia imbricata* (the hawk's-bill turtle), a species which inhabits tropical seas. The horny scales or plates which form the covering of this animal are extensively used in the manufacture of combs, snuff-boxes, &c., and in inlaying and other ornamental work. It becomes very plastic when heated, and when cold retains with sharpness any form it may be moulded to in its heated state. Pieces can also be welded together under the pressure of hot irons. The quality of tortoise-shell depends mainly on the thickness and size of the scales, and in a smaller degree upon the clearness and brilliancy of the colours. The

Hawk's-bill or Tortoise-shell Turtle (*Chelonia imbricata*).

best tortoise-shell is that of the Indian Archipelago. It is now largely and successfully imitated by horn, and artificial com-

pounds of much less cost.—*Tortoise-shell butterfly*, a name given by collectors to *Vanessa polychloros* and *V. urtica*.

2. A political party name first used in England about 1679, and applied originally as an epithet of reproach to all who were supposed to be abettors of the imaginary Popish Plot; and then generally to those who refused to concur in excluding a Roman Catholic prince (in the particular instance James II.) from the throne. The nickname, like its contemporaneous opposite *Whig*, in coming into popular use became much less strict in its application, until at last it came simply to signify an adherent of that political party in the state who disapproved of change in the ancient constitution, and who supported the claims and authority of the king, church, and aristocracy, while their opponents, the Whigs, were in favour of more or less radical changes, and supported the claims of the democracy. In modern times the term has to some extent been supplanted by *Conservative*, and the Conservative may be considered as the modern representative of the ancient Tory. See *CONSERVATIVE*.

It is curious how often political parties have ended by assuming to themselves names first fastened on them by their adversaries in reproach and scorn. . . . *Tories* was a name properly belonging to the Irish beggar-troops, who during our Civil War robbed and plundered, professing to be in arms for the maintenance of the royal cause, and from them transferred about the year 1680, to those who sought to maintain the extreme prerogatives of the Crown. *Trench.*

Toss (tos), *v. t.* pret. & pp. *tossed* or *tost*. [Of doubtful origin. Wedgwood connects it with N. *tossa*, to strew, to scatter. The writers openly showed that they were entirely out of sympathy with the Reformers of the sixteenth century, and boldly taught the doctrines of priestly absolutism, the real presence, the paramount authority of the church, and the value of tradition; that there was no insurmountable barrier between the Roman Catholic and the Anglican communions; and that the Thirty-nine Articles, though drawn up by Protestants, are susceptible of a Catholic interpretation not inconsistent with the doctrines of the Council of Trent. Trade-wind (trād'wind), *n.* [That is, wind blowing in a regular *trade* or course.] One of those perpetual or constant winds which occur in all open seas on both sides of the equator, and to the distance of about 30° north and south of it. On the north of the equator their direction is from the north-east (varying at times a point or two of the compass either way); on the south of the equator they proceed from the south-east. The origin of the trade-winds is this:—The great heat of the torrid zone rarefies and makes lighter the air of that region, and in consequence of this rarefaction the air rises and ascends into the higher regions of the atmosphere. To supply its place colder air from the northern and southern regions rushes towards the equator, which, also becoming rarefied, ascends in its turn. The heated air which thus ascends into the upper regions of the atmosphere being there condensed flows northward and southward to supply the deficiency caused by the undercurrents blowing towards the equator. These undercurrents coming from the north and south are, in consequence of the earth's rotation on its axis, deflected from their course as they approach the equatorial region, and thus become north-east and south-east winds, constituting the trade-winds. The belt between the two trade-winds is characterized by calms, frequently interrupted, however, by violent storms. The position of the sun has an influence on the strength and direction of the trade-winds, for when the sun is near the tropic of Cancer the south-east wind becomes gradually more southerly and stronger and the north-east weaker and more easterly. The effect is reversed when the sun approaches towards the tropic of Capricorn. Trade-winds are constant only over the open ocean, and the larger the expanse of ocean over which they blow (as in the Pacific) the more steady they are. When these winds blow over land they are obstructed and their direction changed by coming in contact with high land or mountains. In some places the trade-winds become periodical, blowing one half of the year in one direction and the other half in the opposite direction. See MOSSOON.

It may be made the cloak for every species of flagitious and sordid calculation; and what in him was only a sophistical self-deception, or a mere illusion of dangerous self-love, might have been, by the common herd of *trading* politicians, used as the cover for every low and despicable and unprincipled artifice. *Brougham.*

But let us look a little more closely into this mysterious *tradition*, and endeavour to estimate it at its worth. It is a name for a multitude of tales and reports that were afloat in the early ages of Christianity—the hearsay of the church—compounded of fact and fiction, of the marvellous and the sober, of the

probable and the absurd, thrown together in one indissoluble mass. To confide the perpetual miracle of infallibility to such proof as this betrays surely extraordinary notions of the value of evidence.

A dramatic poem, representing an important event or a series of events in the life of some person or persons, in which the diction is elevated and the catastrophe melancholy; that kind of drama which represents a tragical situation or a tragical character. Tragedy originated among the Greeks in the worship of the god Dionysus or Bacchus. A Greek tragedy always consisted of two distinct parts: the dialogue, which corresponded in its general features to the dramatical compositions of modern times; and the chorus, the whole tone of which was lyrical rather than dramatical, and which was meant to be sung, while the dialogue was intended to be recited. The unity of time; namely, that the duration of the action should not exceed twenty-four hours; and that of place, namely, that the scene in which the events occur should be the same throughout, are modern inventions.

In *metaph.* (a) an expression employed by the schoolmen to mark a term or notion which *transcended*, that is, which rose above, and thus included under it, the categories of Aristotle: such, for example, as 'being,' of which the ten categories are only subdivisions. (See **CATEGORY**.) In this sense the word is convertible with *transcendental* as used by scholastic philosophers. (b) In the philosophy of Kant, a term applied to the elements of thought,

notions, ideas, &c., that altogether transcend experience, which may seem to be given in experience, but which really are not given. Such are the ideas of the pure reason, God, an immaterial soul, &c. In this sense the word does not correspond with *transcendental* as used by Kant and his followers. See **TRANSCENDENTAL**.

[A colloquial and inaccurate use of the term.] See **TRANSCENDENTALISM**.

P. Marsh.*

4. In *math.* a term applied to any equation, curve, or quantity which cannot be represented or defined by an algebraical expression of a finite number of terms, with numerical and determinate indexes. Transcendental quantities include all exponential, logarithmic, and trigonometrical lines, because there is no finite algebraical formulae by which these quantities can be expressed — *Transcendental equation* is an equation into which transcendental quantities enter. But transcendental equations sometimes signify such differential equations as can only be integrated by means of some curve, logarithm, or infinite series — *Transcendental curve* is such as cannot be defined by any algebraic equation, or of which, when it is expressed by an equation, one of the terms is a variable quantity — *Transcendental anatomy*, that branch of anatomy which treats of the essential nature and homologies of the parts of the body, and the results of which study seem to differ from or lie beyond what would be suggested by the ideas of the parts conveyed by the external senses. *Brande & Cox.*

Transcendental (trans-sen-dent'al), *n.* A transcendentalist.

Transcendentalism (trans-sen-dent'al-izm), *n.* 1. The state or quality of being transcendental. Specifically — 2. A term sometimes applied to the system of philosophy founded by Kant. In this philosophy all those principles of knowledge which are original and primary, and which are determined *a priori*, all purely subjective forms of intuition (as space and time), are called transcendental. They involve necessarily and strictly (not comparatively) universal truths, and so transcend all truth derived from experience, which must always be contingent and particular. The principles of knowledge, which are pure and transcendental, form the foundation of all knowledge that is empirical, derived from experience or determined *a posteriori*. As Schelling and Hegel claim to have discovered the absolute identity of the objective and subjective in human knowledge, or of things and human conceptions of them, the Kantian distinction between *transcendental* and *transcendental* ideas can have no place in their philosophy. And hence with them *transcendentalism* claims to have a true knowledge of all things material and immaterial, human and divine, so far as the mind is capable of knowing them. And in this sense the word is now most generally used. It is also sometimes used for that which is vague and illusive in philosophy.

In *astron.* (a) the passage of a heavenly body across the meridian of any place. The determination of the exact times of the transits of the heavenly bodies across the meridian of the place of observation enables the astronomer to ascertain the differences of right ascen-

sions, and the relative situations of the fixed stars, and the motions of the sun, planets, and comets, in respect of the celestial meridians. (b) The passage of one heavenly body over the disc of a larger one. But the term is chiefly restricted to the passage of the inferior planets, Mercury and Venus, over the sun's disc. The transits of Venus are of great importance in astronomy, as they afford the best means of determining the sun's parallax, and consequently the dimensions of the planetary system. These tran-

sits are of rare occurrence, four taking place in 243 years, at intervals reckoning from the transit of 1874, in the order of 8, 122, 8, and 105 years, which gives the transit years 1874 (Dec. 6), 2004, 2012, 2117. The transits of Mercury occur more frequently, but they are of far less astronomical interest, as they cannot be used for the same purpose, the planet being too distant from us. (c) A transit instrument.

Transit-instrument (tran-'sit-in-'stru-mēt), *n.* An important astronomical instrument, which consists essentially of a telescope fixed at right angles to a horizontal axis, having its ends directed to the east and west points of the horizon, so that the line of collimation of the telescope may move in the plane of the meridian. The instrument is susceptible of certain nice adjustments, so that the axis can be made perfectly horizontal, and at right angles to the plane of the meridian, in which plane the telescope must move. The principal use of the transit instrument is to determine the exact moment when a celestial body passes the meridian of the place of observation. See **TRANSIT**.

Transition (tran-'si-zhōn or tran-'zi-'shōn), *n.* [L. *transitio*, from *transseo*. See **TRANSIT**] 1. Passage from one place or state to another; change; as, the *transition* of the weather from hot to cold.

which may be more or less related.—This word is frequently used adjectively (chiefly in such a connection as shown in the quotation) as equivalent to passing from one place or condition to another, changing, transitional.

—*Transition-rocks, transition-series, or transition formations*, in *geol.* names formerly given to the older secondary rocks, or to the lowest uncrystalline stratified rocks, erroneously supposed to contain no organic remains, and so named because they were considered to have been formed when the world was passing from an uninhabitable to a habitable state. 3. In *gram.* taking an object after it; denoting action passing to an object that is expressed; as, a *transitive* verb; a *transitive* usage. A comparison of the velocity of transpiration with that of effusion has led to important conclusions in regard to molecular magnitudes.—*Transpiration of liquids* is analogous to transpiration of gases, and refers to the rates at which liquids pass through minute orifices or capillary tubes under pressure. Trawling (tral'ing), *n.* The act of fishing with a trawl-net. It is the mode chiefly adopted in deep-sea fishing, and by which the greater quantity of the fish for the London market is taken, with the exception of herring and mackerel. Cod, whiting, and other white fish are taken by it in large numbers, and some kinds of flat fish, as soles, can scarcely be taken in any other way. Trawling can be practised only on a smooth bottom, as a rough bottom would destroy the net. The vessels employed in it on the east coast of England are from 35 to 60 tons, and the fishers often remain out for six weeks, special vessels being employed to carry the fish ashore. Steam trawlers are now common. See TRAWL-NET.

ing on these steps. During the operation the prisoners have the support of a horizontal handrail, and the work and speed is graduated by a brake controlled by an overseer. See TRADITION.] A betraying, treachery, or breach of faith, especially by a subject against the sovereign, liege lord, or chief authority of the state. Treason against the sovereign has, in England, been always regarded as *high treason*, in contradistinction to certain offences against private superiors, which were formerly ranked as *petit* or *petty treason*. (See under PETIT.) There are a number of different species of treason, five of which were declared by an act passed in the time of Edward III.

(1) When a subject doth compass or imagine the death of the king, of his queen, or of their eldest son and heir. (2) If a man do violate the king's companion (that is, wife), or the king's eldest daughter unmarried, or the wife of the king's eldest son and heir. (3) If a man do levy war against the king within the realm. (4) Adhering to the king's enemies in his realm, or giving them aid or comfort. (5) Slaying the chancellor, treasurer, or king's justices. Several other kinds of treason were subsequently defined; thus in the time of Anne attempts to subvert the Act of Settlement were so characterized. So after the accession of Queen Victoria the marrying or promoting the marriage of any child of the present queen, being under eighteen years of age, should the crown

have descended to him or her, without the written consent of the regent and parliament was declared treason. Misprision or bare concealment of treason is no longer a capital offence. The counterfeiting of the king's privy or great seal and of the king's money was at one time also regarded as treason. The former punishment for treason was that the condemned should be drawn on a hurdle to the place of execution, and there to be hanged and disembowelled alive, and then beheaded and quartered; and a conviction was followed by forfeiture of land and goods, and attainder of blood; but this is now restricted to hanging, forfeiture and attainder being abolished by 33 and 34 Vict. xliii. In the United States treason is confined to the actual levying of war against the United States, or in adhering to their enemies, giving them aid and comfort.

Treasure-trove (trezh'ür-tröv), *n.* [*Treasure*, and O. Fr. *trouv*, Mod. Fr. *trouv*, found.] In law, any money or coin, gold, silver plate, or bullion found hidden in the earth or in any private place the owner of which is not known. In this case the treasure belongs to the crown; but if the owner is known, or is ascertained after the treasure is found, the owner and not the crown is entitled to it. It is, however, the practice of the crown to pay the finder the full value of the property on its being delivered up. On the other hand, should the finder conceal or appropriate it he is guilty of an indictable offence punishable by fine and imprisonment.

Treasurous (trezh'ür-us), *a.* Worthy of being treasured or prized, or regarded as a treasure.

Goddess full of grace,
And *treasurous* angel t' all the human race

Chapman.

Treasury (trezh'ür-ri), *n.* 1. A place or building in which stores of wealth are deposited; particularly, a place where the public revenues are deposited and kept, and where money is disbursed to defray the expenses of government; also, a place where the funds of an incorporated company or private society are deposited and disbursed.—2. A department of government which has control over the management, collection, and expenditure of the public revenue. The duties of this department in Britain are at present performed by a board of five lords-commissioners instead of a lord high treasurer, as in former times. The chief of these commissioners, or first lord of the treasury, is, by custom, the head of the administration or prime minister, and may be a member of either house of parliament. He has an extensive ecclesiastical, legal, and civil patronage, appoints all the chief officers of state, and regulates the various departments under the crown. As head of the executive his duties are so multifarious that he takes little practical control of the treasury unless he holds in addition the chancellorship of the exchequer, which he can only do, however, if he is a commoner. The virtual head of the treasury is the chancellor of the exchequer, who must be a member of the House of Commons, and who exercises the most responsible control over the expenditure of the different branches of the service. He prepares an annual estimate of the state expenses, and of the ways and means by which it is proposed to meet them, and lays this statement, called the budget, before the House of Commons. The duties of the three remaining members of the board, the junior lords, are merely formal, the heaviest portion of the executive functions devolving on the two joint secretaries of the department, who are also members of the lower

house, and on a permanent official secretary. One of the joint secretaries is usually the ministerial 'whip,' who has the non-official but important duty of looking after the interest of his party by securing the attendance of as many members as possible on his own side of the house at important divisions. The custody of the public revenue is vested in the exchequer, but the function of payment belongs to the treasury, consequently all sums withdrawn from the exchequer must be vouched for by a treasury warrant. The treasury has the appointment of all officers engaged in the collection of the public revenue; the army, navy, and civil service supplies are issued under its authority; and all exceptional cases and disputes relating to the public revenue are referred to its decision. Several important state departments, as the boards of customs and inland revenue, the post-office, the office of woods and forests, are under the general authority or regulation of the treasury.—*Treasury bench*, the front bench or row of seats on the right hand of the speaker in the House of Commons: so called because occupied by the first lord of the treasury (when a commoner), the chancellor of the exchequer, and other members of the ministry.—*Treasury board*, the five lords-commissioners of the treasury.—*Treasury warrant*, a warrant or voucher issued by the treasury for sums disbursed by the exchequer.—3. It is a rather repulsive looking animal, somewhat resembling the land slug in shape, but having rows of longish suckers on its body, and a radiated mouth. It varies in length from 6 to 24 inches. Much skill and care is required in the operation of curing, which is performed by gutting and boiling the slugs, and spreading them out on a perforated platform over a wood fire to dry. Sun-dried trepangs are in special request in China for making soups. The fishery is carried on in numerous localities in the Indian Ocean, the Eastern Archipelago, and on the shores of Australia. The centre-pin is fixed in the skull, and forms an axis round which the circular edge of the saw rotates, and as soon as the teeth of the saw have made a circular groove in which they can work steadily the centre-pin is removed. The saw is made to cut through the bone, not by a series of complete rotations such as are made by the trepan, but by rapid half rotations alternately to the right and left, as in boring with an awl. The trephine is used especially in injuries of the head, and in cases resulting from injuries for which the removal of a portion of the brain is necessary. The use of the trephine, however, is now much more rarely required than in former times, owing to improved modes of treating cases to which it was formerly applied, and the invention of simpler and more effective instruments.

The female begins to produce embryos in extraordinary numbers, which gain entrance into the muscles by penetrating the mucous coat of the intestine and entering the capillaries, whence they are carried to their habitat by the circulation. There they disorganize the surrounding tissue, setting up at the same time morbid action in the system. The connection between the muscle-inhabiting larva and the adult intestinal parasite was not established till 1860. The species are strong-scented herbs with trifoliate leaves, and small blue, yellow, or white flowers, growing singly or in heads or racemes in the axils of the leaves. They are natives chiefly of Europe, Asia, and North Africa. *T. fœnum græcum* (the common fenugreek) is a native of the South of Europe. Its seeds were in high repute among the ancient Egyptians, Greeks, and Romans for medicinal as well as culinary purposes, and are still used by grocers and farmers as a medicine for horses. In some parts of the south of Germany this plant is cultivated as fodder for horses and sheep.

Trigonometrical (tri-gō-nō-met'rik-al), *a.* Pertaining to trigonometry; performed by or according to the rules of trigonometry. — *Trigonometrical canon*, a table which, beginning from one second or one minute, expresses in order the lengths which every sine, tangent, and secant have in respect of the radius, which is supposed unity. — *Trigonometrical curves*, a name given to certain curves which have such equations as $y = \sin x$, $y = \cos x$, $y = a \cos x + b \cos 2x$, &c. These curves may be constructed from the fundamental properties of the sine, cosine, &c. — *Trigonometrical lines*, lines which are employed in solving the different cases of plane and spherical trigonometry, as radius, sines, tangents, secants, cosines, cotangents, cosecants, &c. These lines, or the lengths of them, are called the *trigonometrical functions* of the arcs to which they belong. When an arc increases through all its values from 0° to 360°, the sines and cosines are positive in the first and second quadrants, and negative in the third and fourth; the tangents and cotangents are positive in the first and third, and negative in the second and fourth; the cosines and secants are positive in the first and fourth, and negative in the second and third; and the versed sines are positive in all the four quadrants. — *Trigonometrical series*, infinite series which are of the form $a \sin x + b \sin 2x + c \sin 3x$, &c., and $a \cos x + b \cos 2x + c \cos 3x$, &c. — *Trigonometrical survey*, a term which may be applied to any survey of a country which is carried on from a single base, by the computation of observed angular distances; but the term is usually confined to measurements on a large scale, embracing a considerable extent of country, and requiring a combination of astronomical and geodetical operations. A trigonometrical survey may be undertaken either to ascertain the exact situation of the different points of a country relatively to each other, and to the equator and meridians of the terrestrial globe, for the purpose of constructing an accurate map, or to determine the dimensions and form of the earth, by ascertaining the curvature of a given portion of its surface, or by measuring an arc of the meridian. The most minute accuracy and the most perfect instruments are required in all the practical parts of such operations; and it becomes necessary to have regard to the curvature of the earth's surface, the effects of temperature, refraction, altitude above the level of the sea, and a multitude of circumstances which are not taken into account in ordinary surveying. In conducting a trigonometrical survey of a country (as the ordnance survey of Britain), signals, such as spires, towers, poles erected on elevated situations, or other objects, are assumed at as great a distance as will admit of distinct and accurate observations, with telescopes of considerable power attached to the instruments used in measuring the angles. In this way, starting from a measured base-line, the country will be divided into a series of connected triangles called *primary triangles*; and any side of any one of these being known, the remaining sides of all of them may be computed by trigonometry. By means exactly similar, each of these triangles is resolved into a number of others called *secondary triangles*; and thus the positions of towns, villages, and other objects are determined. The length of the base or line measured, which is an arc of a great circle, must be determined with extreme accuracy, as an error in measuring it would affect the entire survey. For checking the measurements and the computations it is proper to measure some other line at a considerable distance from the first, as the comparison of its measured and computed lengths will be a test of the accuracy of the intermediate operations. Such a line is called a base of verification. The measurement of a base is one of the principal difficulties in the survey, chiefly on account of the inequalities of the earth's surface, and the variations in the length of the measuring instrument, arising from the change of temperature.

The base is assumed on as flat a portion of country as can be obtained, and the chain or other measuring instrument is constructed with extreme care.

Trigonometrically (tri-gō-nō-met'rik-al-i), *adv.* In a trigonometrical manner; according to the rules or principles of trigonometry.

Trigonometry (tri-gō-nō-met'ri), *n.* [From Gr. *trigōnon*, a triangle, and *metron*, a measure.] According to the primitive meaning of the term, the measuring of triangles, or the science of determining the sides and angles of triangles, by means of certain parts which are given; but in its modern acceptance it includes all theorems and formulae relative to angles and circular arcs, and the lines connected with them, these lines being expressed by numbers or ratios. In fact, the principles of trigonometry are of very general application, furnishing means of investigation in almost every branch of mathematics. Trigonometry, in relation to its practical utility, may be regarded as the most important of all the applications of mathematics, especially in relation to astronomy, navigation, and surveying. Trigonometry is of two kinds, *plane* and *spherical*. The former treating of triangles described on a plane, and the latter of those described on the surface of a sphere. In every triangle there are six things which may be considered, viz. the three sides and the three angles, and the main object of the theoretical part of trigonometry is to deduce rules by which, when some of these are given, the others may be found by computation, such computations being facilitated by tables of sines, tangents, &c. In plane trigonometry any three of the six parts of a triangle being given (except the three angles), the other parts may be determined; but in spherical trigonometry this exception

has no place, for any three of the six parts being given, the rest may thence be determined, the sides being measured or estimated by degrees, minutes, &c., as well as the angles.

The mode in which trigonometrical definitions are given is as follows:—Let ABC be a right-angled triangle, then

$\frac{CB}{AC} = \text{sine of } A$; $\frac{AB}{AC} = \text{cosine of } A$; $\frac{BC}{AB} = \text{tangent of } A$; $\frac{AB}{CB} = \text{cotangent of } A$; $\frac{AC}{CB} = \text{secant of } A$; $\frac{AC}{AB} = \text{cosecant of } A$; $1 - \text{cosine of } A = \text{versed sine of } A$; $1 - \text{sine of } A = \text{co-versed sine of } A$. Both plane and spherical trigonometry is divided into right-angled and oblique-angled.

Trilobites are especially characteristic of the Silurian strata; about a dozen genera appear in the Devonian, three or four in the carboniferous, and none higher. They comprehend those species in which the body is divided into three lobes, which run parallel to its axis. Trilobites are supposed by Burmeister to have moved by swimming in an inverted position, belly up, immediately beneath the surface of the water. When attacked they could roll themselves into a ball. They fed on small water animals, and inhabited gregariously and in vast numbers the shallow water near coasts. No antennæ or limbs have yet been detected; 'still,' says Owen, 'there can be no doubt they enjoyed such locomotive powers as even the limpet and chiton exhibit.' The lenses of the eye are frequently beautifully preserved so as to be perceptible by the naked eye. In *Asaphus caudatus* each eye has 400 facets, and in *A. tyrannus* 6000. In *Rom. antiq.* a magnificent procession in honour of a victorious general, and the highest military honour which he could obtain. It was granted by the senate only to one who had held the office of dictator, of consul, or of pretor, and after a decisive victory or the complete subjugation of a province. In a Roman triumph the general to whom this honour was awarded entered the city of Rome in a chariot drawn by four horses, crowned with laurel, and having a sceptre in one hand and a branch of laurel in the other. He was preceded by the senate and magistrates, musicians, the spoils, the captives in fetters, &c., and followed by his army on foot, in marching order. The procession advanced in this order along the *via sacra* to the Capitol, where a bull was sacrificed to Jupiter, and the laurel wreath deposited in the lap of the god. Banquets and other entertainments concluded the solemnity, which was generally brought to a close in one day, though in later times it sometimes lasted for three days. Trope (trôp), *n.* [Fr. *trôpe*, from L. *tropus*, from Gr. *tropos*, a trope or figure, a turn, from *trêpô*, to turn.] In *rhet.* a figurative use of a word; a word or expression used in a different sense from that which it properly possesses, or a word changed from its original signification to another for the sake of giving life or emphasis to an idea; as when we call a stupid fellow an ass, or a shrewd man a fox. Tropes are chiefly of four kinds: metaphor, metonymy, synecdoche, and irony; but to these may be added allegory, prosopopœia, antonomasia, and perhaps some others. Some authors make figures the genus, of which trope is a species; others make them different things, defining trope to be a change of sense, and figure to be any ornament except what becomes so by such change.

1. In *antiq.* a monument or memorial in commemoration of some victory. It consisted of some of the arms and other spoils of the vanquished enemy, hung upon the trunk of a tree or a stone pillar by the victorious army, either on the field of battle or in the capital of the conquered nation. If a naval victory, it was erected on the nearest land. The custom of erecting trophies was most general among the Greeks, but it passed at length to the Romans. It was the practice also to have representations of trophies carved in stone, in bronze, and other solid substances. In modern times trophies have been erected in churches and other public buildings to commemorate victories.—2. Anything taken and preserved as

a memorial of victory, as arms, flags, standards, and the like, taken from an enemy.

In *astron.* one of two circles on the celestial sphere, whose distances from the equator are each equal to the obliquity of the ecliptic, or 23½° nearly. The northern one touches the ecliptic at the sign Cancer, and is thence called the *tropic of Cancer*, the southern one being for a similar reason called the *tropic of Capricorn*. The sun's annual path in the heavens is bounded by these two circles, and they are called *tropics*, because when the sun, in his journey northward or southward, reaches either of them, he, as it were, *turns back*, and travels in an opposite direction in regard to north and south.—2. In *geog.* one of two parallels of latitude, each at the same distance from the terrestrial equator as the celestial tropics are from the celestial equator. The one north of the equator is called the *tropic of Cancer*, and that south of the equator the *tropic of Capricorn*. Over these circles the sun is vertical when his declination is greatest, and they include that portion of the globe called the torrid zone, a zone 47° wide, having the equator for its central line.—3. *pl.* The regions lying between the tropics or near them on either side. In this action the plaintiff could not recover the specific chattel, but only damages for its conversion. It is no longer a technical form of action.

As the avoirdupois pound (the weight in general commercial use) contains 7000 grains, and the ounce 437½ grains, the troy pound is to the avoirdupois as 144 to 175, and the troy ounce to the avoirdupois as 192 to 175.

5. In *building*, a combination of timbers, of iron, or of timbers and iron work, so arranged as to constitute an unyielding frame. The simplest example of a truss is the principal or main couple of a roof, in which *aa* (fig. 1), the tie-beam, is suspended in the middle by the king-post *b* to the apex of the angle formed by the meeting of the rafters *cc*. The feet of the rafters being tied together by the beam *a*, and being thus incapable of yielding in the direction of their length, their apex becomes a fixed point, to which the beam *a* is *trussed* or tied up to prevent its sagging, and to prevent the rafters from sagging there are inserted the struts *dd*. There are other forms of truss suited to different purposes, but the conditions are the same in all, viz. the establishing of fixed points to which the tie-beam is trussed. Thus, in fig. 2, two points *aa*, are substituted for the single one, and two suspending posts are required. These are called *queen-posts*, and the truss is called a *queen-post truss*. The principle of the truss has been widely adopted in bridge building. See **ROOF**.—6. In *arch*, a large corbel or modillion supporting a mural monument, or any object projecting from the face of

According to Dr. Reid, the truths that fall within the compass of human knowledge, whether they be self-evident or deduced from those that are self-evident, may be reduced to two classes, namely, necessary, immutable, or first truths, and contingent and mutable truths. A necessary truth is one that depends not upon the will and power of any being; it is immutably true, and its contrary impossible. A contingent truth is one which depends upon some effect of will and power, which had a beginning and may have an end. Of the first class are the relations of numbers (as that two and two make four), axioms in mathematics, and all the conclusions drawn from them; that is, the whole body of the science of mathematics. To the second class of truths, viz., those that are contingent, belong all those truths that express matters of fact or real existences (as that grass is green), depending upon the will and power of the Supreme Being.—*In truth*, in reality; in fact; in sincerity.

growth, and not a mere enlargement of a natural part, which is called hypertrophy. Tumours may be divided into three well-defined classes: (a) *simple, solid, benign, or innocent tumours*, the substance of which has anatomical resemblance to some tissues of the body; they gradually increase in size, and generally only produce inconvenience from the great bulk they sometimes attain; a complete cure may be effected by simple excision. (b) *Malignant or cancerous tumours*, which bear no resemblance in substance to normal tissue; they are exceedingly liable to ulceration, they invade all the textures of the part in which they occur, affecting the mass of the blood, and terminate fatally; when excised they are apt to recur in remote parts of the body. (c) *Semimalignant tumours*, which closely resemble in structure the part in which they are seated; they may recur after excision, or may gradually spread to all the neighbouring tissues, and ultimately cause death by ulceration; but they do not affect the lymphatic system nor reappear in remote parts of the body after excision. Innocent tumours are often named from the tissues in which they occur, as *adipose or fatty tumours*, *fibrous tumours*, *cartilaginous tumours*, *bony tumours*, and the like. W.* A metal discovered by D'Elhnyart in 1781. It has a grayish white colour, and considerable lustre. It is brittle, nearly as hard as steel, and less fusible than manganese. Its specific gravity varies from 17.5 to 19.5. When heated to redness in the open air it takes fire, and is converted into tungstic oxide (WO_3), and it undergoes the same change by the action of hydrochloric acid. Digested with a concentrated solution of pure potash, it is dissolved with disengagement of hydrogen gas, and tungstate of potash is generated. The ores of this metal are the native tungstate of lime, and the tungstate of iron and manganese, which latter is also known by the name of wolfram, and the same name is also given to the metal. Tungsten may be procured in the metallic state by exposing tungstic oxide to the action of charcoal or dry hydrogen gas at a red heat, but an exceedingly intense heat is required for fusing the metal. 2. by the escape of water through orifices, under the influence of pressure derived from a fall. Turbines are now made after a vast variety of patterns. The oldest and simplest is the Scotch turbine, or Barker's mill (which see). In another common form the water passes vertically down through the wheel between fixed screw blades, which give it a spiral motion, and then strikes similar blades attached to a movable spindle, but placed in the opposite direction, so that the impact of the water communicates a rotatory motion to the blades and spindles. Or the

water may be passed from the centre horizontally outwards through fixed curved blades, so as to give it a tangential motion, and thereby cause it to act on the blades of the wheel which revolves outside. In the example represented in the annexed cut, the water is introduced into a close cast-iron vessel *a*, by the pipe *b*, connecting it with the reservoir. Here, by virtue of its pressure, it tends to escape by any aperture which may be presented; but the only apertures consist of a series of curved float-boards *f f*, fixed to a horizontal plate *g*, mounted upon a central axis *h*, which passes upwards through a tube connecting the upper and lower covers, *c* and *d*, of the vessel *a*. Another series of curved plates *e e*, is fixed to the upper surface of the disc *d*, to give a determinate direction to the water before flowing out at the float-boards, and the curves of these various parts are so adjusted as to render the reactive force of the water available to the utmost extent in producing a circular motion, and thus carrying round the disc and the axis *h* with which the machinery to be impelled is connected.

D. *turbot* would like the English be borrowed forms. W. *torbit* seems to be from *tor*, a bulge, a belly, and *pet*, something short and squat. Diez and Brachet, however, would derive Fr. *turbot* from L. *turbo*, a whipping top, comparing Gr. *rhombos*, which means both top and turbot, there being a supposed similarity in shape. The latter part of the word might also be explained as meaning flat-fish by itself—but in *halibut*, D. *bot*, a plaice, G. *butte*, a flat-fish; comp. also G. *butt*, Dan. *but*, short and thick.] A well-known and highly esteemed fish of the genus *Rhombus* or *Pleuronectes* (*R.* or *P. maximus*), family *Pleuronectidæ* or flat-fishes. 3. The art or operation of giving circular and

other forms to bodies, as wood, metal, bone, ivory, &c., by making them revolve in various manners in a machine called a *lathe*, and applying cutting instruments so as to produce the form required, or by making the cutting instrument revolve when the substance to be operated upon is fixed. In ordinary turning the body operated upon is made to revolve on a stationary axis, and a cutting tool applied to its surface in such a way as, in the circumvolutions of the object, to cut off those parts which lie farthest from the axis, and make the outside of the substance concentric with the axis. In this case any section of the work made at right angles to its axis will be of a circular figure; but there are methods of turning several other curves in a variety of ways. Turnip (tér'nip), *n.* [Formerly also *turnep*. The latter part of the word is A. Sax. *næp*, Icel. *næpa*, Sc. *næp*, a turnip, borrowed from L. *næpus*, a turnip or plant allied to the turnip. It is difficult to account for the first syllable. It may perhaps be W. *tör*, something bulging, a belly, the epithet being applied to distinguish the turnip from the rape or cabbage that do not have a swelling root; but this explanation is not quite satisfactory.] The common name of the *Brassica Rapa*, a cruciferous, biennial plant, much cultivated both in the field and in the garden on account of its esculent root. The radical leaves are oblong and lyrate, the upper ones entire; the flowers usually yellow. The upper part of the root, which in the wild state is a comparatively hard woody substance, has been transformed by cultivation into a large fleshy bulb. The turnip, as a culinary vegetable and as a cattle food, was well known to the Greeks and Romans, the latter of whom may have introduced it into gardens in Britain. The root is generally used as a culinary vegetable in all temperate climates; the leaves and flower-shoots are used as greens, and the seed-leaves as a salad. The field culture of the larger-rooted varieties has proved of great advantage to the British farmer, supplying a very valuable rotation crop, and providing a winter food for cattle and sheep. The most advantageous mode of field culture is by drills, which will produce crops of treble the weight of those grown in the broadcast manner. The roots of the turnip have often a tendency to divide and become hard and worthless—a condition known as finger-and-toe, or dactylorhiza. This disease seems to be a tendency of the plant to return to the wild state, and is best met by the farmer using new and selected seed. The plant thrives best on rich and free soil and in moist cloudy weather. The Swedish turnip is probably a hybrid between *B. campestris* and *B. Rapa* or *Næpus*. *B. Napus* yields rape, cole, or colza seeds, from which a well-known fixed oil is expressed.

Athalia centifoliae. The larvæ of this fly, popularly known as *niggers*, are very destructive to the leaves of the turnip, and

It is used for removing single carriages from one line of rails to another, and also for reversing engines on the same line of rails. The annexed figures illustrate its mechanism. In fig. 1, *a, a* are solid rails of wrought iron, corresponding with the gauge of the lines *A, B*; *k* is a rim of iron within which the plate turns, but the space within the rails *b, b* is in general covered with wood; *l, l* are latches fixed on the outer rim, and dropping into notches as at *m*. being in like manner turned a quarter round, the carriage is in a proper position for being moved on to the track *B*. By this arrange-

parts of the atmosphere which are still illuminated after the sun has become invisible from ordinary heights. The morning twilight is said to begin, and the evening twilight to end, in our latitudes when the sun is 18° below the horizon, but much depends on the state of the atmosphere as to clouds, &c. Twilight is of longer duration in high latitudes than at or near the equator on account of the obliquity of his course. When he sinks perpendicularly below the horizon naturally there is little twilight.—2. A faint light in general. 'Mid the dim twilight of the laurel grove,' *Milman*. Hence.—3. The effect of this is to produce the appearance of parallel diagonal lines or ribs over the whole surface of the cloth; but the regularity of the parallel lines is broken in various ways in what is termed fanciful twilling.—2. The six types or plans of structure upon one or other of which all known animals have been constructed are technically called 'sub-kingdoms,' and are known by the names Protozoa, Coelenterata, Annuloida, Annu-losa, Mollusca, and Vertebrata. We have then to remember that every member of these primary divisions of the animal kingdom agrees with every other member of the same division in being formed upon a certain plan or type of structure, and differs from every other simply in the grade of its organization, or, in other words, in the degree to which it exhibits specialization of function. *H. The different parts of a type are technically named as follows: the *body* or *shank* (a), the rectangular solid itself; the *face* (b), the raised letter or character; the *beard* (c), the part of the end of the body unoccupied by the

face; the *nick* (or *nieks*, *d d*), a notch made on one side of the prism, and designed to assist the compositor in distinguishing

the bottom of the face from the top; the groove (*e*), a channel made in the bottom or foot of the type to make it stand steadily. The fine lines at the top and bottom of a letter are called *ceriffs*; the parts of the face of some letters, such as *j* and *f*, which project over the body, are called *kerfs*. From the character of the letters types are known as CAPITALS, small or lower case letters, *italics*, script, &c. There are several varieties of machines for this purpose, but ordinarily they all possess the following leading features: they have separate galleys or pockets for each sort of type, and the mechanical arrangement is such that on touching a key, arranged with others like the keyboard of a piano, the end type of the row is displaced, and conducted in a channel or by a tape to a composing-stick, where the types are arranged in a regular order in a line of indefinite length; thence they are removed in successive portions to a justifying stick, in which they are spaced out to the proper length of line required.

Type-writer (tip'rit-ér), *n.* 1. A machine intended to be used as a substitute for the pen, and by which the letters are produced by the impression of inked types. The essential elements in such machines (of which there are several varieties) is a movement to bring the type into position, an inking device, an impression movement, and means for letter and line spacing. There are generally a series of letter keys arranged in rows, to be worked by the fingers, a letter being imprinted on the paper (which moves automatically) each time a key is struck.—2. It is a native of South Africa.

They resemble at first sight earthworms, and are found in the hot portions of both hemispheres. They differ from all other reptiles in possessing teeth in only one of the jaws. The typical genus is *Typhlops*, and there are several others.

Typhoid (tí-foid), *a.* Of, pertaining to, or resembling typhus; as, a *typhoid fever*; *typhoid symptoms*.—*Typhoid fever*, a species of continued fever, characterized by abdominal pains and diarrhoea due to ulceration of the intestines, frequently by derangement in the functions of the lungs and brain, by spots on the skin, and analogous in many respects to eruptive fevers. Unlike the spots of typhus those of typhoid fever disappear on pressure. By some authorities typhoid and typhus fevers have been regarded as the less and greater degree of one common disease, but the majority of physicians now consider them to be distinct diseases with certain resemblances. Typhus has generally prevailed as an epidemic where insanitary conditions, overcrowding, and famine have prevailed; the rebreathing of air loaded with emanations from crowded living beings being its chief cause. Typhoid, on the other hand, is now far more common, occurring among all classes of society, in isolated and healthy villages, as well as in the larger cities. It may be induced by purely external causes, as by bad ventilation, sewer-gas, exhalations of decomposing matter in cellars or near houses, privies, and especially the contamination of drinking water. It is also of longer duration than typhus, there being at least three full weeks of the active fever, followed by several weeks' gradual convalescence, while in the average from typhus speedy recovery ensues at the end of the second week. Known also as *Enteric* and *Gastric Fever*.

Typhus (tí-fus), *n.* [Gr. *typhos*, stupor or coma.] A species of continued fever attended by great debility. It is contagious or infectious, and often epidemic, but is most prone

to attack debilitated persons, and is aided in its progress by want of cleanliness, good food, and fresh air. With the sanitary reform of overcrowded localities, barracks, jails, ships, &c., the prevalence of this plague has now been considerably diminished. Its attack is generally characterized by inordinate muscular and nervous debility, great depression of spirits, weariness, flying pains, sighing, and a frequent, small, and sometimes fluttering pulse. The tongue is foul and brown, and the taste impaired, and not unfrequently nausea and bilious vomiting prevail. About the fourth or fifth day an eruption of a deep livid colour appears on the abdomen, the spots of which do not disappear on pressure, as those of typhoid do. As the disease advances the debility increases; the speech becomes inarticulate, muttering, and delirious, and there is a tendency to bleeding from the nose, mouth, and bowels. Typhus is frequently fatal, death in the majority of cases supervening before the fifteenth day after attack. This disease is also known as hospital fever, ship-fever, jail-fever, camp-fever, brain-fever, and spotted fever, and has sometimes been considered as an acute form of fever of which typhoid is a less virulent example. See **TYPHOID**.

U.

U. The twenty-first letter and the fifth vowel in the English alphabet. Its true primary sound was that which it still retains in most of the languages of Europe, that of *oo* in *cool*, *tood*, *good*, *wood*, &c., answering to the French *ou* in *tour*, the sound being sometimes short, sometimes long. This sound is one of the original Indo-European vowel-sounds. (See **A**.) In Anglo-Saxon the long sound was often marked with an accent to distinguish it from the short. The former has in modern English commonly become the diphthong *ou* or *ow*, as *A. Sax. thū = thou, nū = now, mūth = mouth*, &c. After *r*, however, and also after the sounds *sh* and *zh*, *u* has generally the old long sound, as in *rule*, *truth*, *sure*, &c., and the same sound differently represented is still heard in *room* = *A. Sax. rām, brook* (verb) = *A. Sax. brācan*. The old short sound of *u* is still retained in some words, as in *bull*, *full*, *put*, &c., but in general this sound became changed (apparently about the middle of the seventeenth century) to the sound heard in *cut*, *tin*, &c., which was a new sound in English. In *us*, *but*, the *u* was originally long. This sound, which is very similar to that of the unaccented French *e*, is characteristic of English, and is often given to the other vowels, *a*, *e*, *o*, when unaccented, as in the words *cavalry*, *sister*, where the italicized vowels have almost, if not altogether, this indistinct, stifled *u*-sound. In the case of *a* this pronunciation is not confined to unaccented vowels, as in numerous instances the accented *a* is exactly equivalent to this sound of *u*; for example, *come*, *money*, *among*, &c. The long sound that this letter commonly represents at the present day, as in *mute*,

pure, *duke*, *diffuse*, &c., is not a simple vowel, the *u*-sound having really an *i*-sound before it. This latter sound seems to have established itself about the beginning of the seventeenth century. Some speakers give *u* this sound even after *r*, but the letter is not commonly so pronounced. Vulgar speakers, again, pronounce such words as *duke*, &c., as if they were written *dook*, &c. The words *bury* and *busy* (with their derivatives) exhibit solitary peculiarities in the pronunciation of this character. The sound of *u* in *mute* is also represented by other combinations, as by *ue* in *due*, *ev* in *dew*, and *ui* in *suit*. With regard to *ue* the remark has been made 'that it is used in later spelling as a final *u* owing to a rule made by no one knows whom, no one knows why, and no one knows when, that no English word can end in *u*.' (*A. J. Ellis*.) In *plague*, *rogue*, &c., *ue* indicates that the preceding vowel is to be pronounced long and the *g* with its hard sound; in *tongue* it is a useless exercise. Besides the sound in *suit*, *ui* has several other sounds, as in *build*, *guide*, *fruit*, *anguish*, *mosquito*, &c. In *buoy* the *u* is no longer heard, and probably it never was heard in *buy*. In the best period of Roman literature the *u*-sound was expressed by the character *V*. The Anglo-Saxon alphabet did not have the character *V* at all, the sound, when it occurred (as between two vowels) being represented by *f*, or occasionally by *u*. In later times *u* and *v* stood indifferently for either sound, the capital being generally written *V*. In the seventeenth century its special function was assigned to each, yet almost every dictionary continued to combine the *u* and *v*, and this was not

quite given up till far on in the present century.—*U*, in *chem.* is the symbol of uranium. *U. C.*, in dates belonging to Roman history, is a contraction for *ab urbe condita*, from the time the city was built; as, *U. C. 400*, the year of Rome 400. *U. K.*, the United Kingdom. *U. P.*, in Scotland, United Presbyterian. *U. S.*, United States. *U. S. A.*, United States of America.

The plants of this order are natives chiefly of the northern parts of the northern hemisphere, inhabiting groves, thickets, plains, marshes, and waste places. They are herbs, seldom shrubs, with fistular furrowed stems. The leaves are in most cases divided; they are alternate, and all of them embrace or clasp the stem by a sheathing petiole. The seed is pendulous, and contains a large quantity of albumen in proportion to the size of the embryo. There are about 152 genera and 1300 species. Some are very poisonous, as hemlock, fool's parsley, and others; others are esculents, as celery, carrots, and parsnips; many yield aromatics, as caraway, coriander, dill, anise; a few secrete a foetid gum-resin, much used in medicine, as asafetida, galbanum, opopanax, and sagapenum.

In German umlaut is seen in the frequent change of the vowels *a, o, u* to *ä, ö, ü*. In Anglo-Saxon it was very common, and it still appears in the plurals *feet* and *geese*, from *foot* and *goose*, the vowels being changed by an *i* that originally followed. Umlaut is therefore a kind of assimilation of sounds. The change caused by *a* is called *a-umlaut*, and so of the others.

The conception of a sound tends to put the vocal organs in a position to utter it. We conceive the later sounds in a word while yet speaking the former; hence the tendency to utter a sound between the two. No umlaut shows in Gothic. Old H. German has most *a-umlaut*; Norse, *u-umlaut*.

Umpirage (um'pir-âj), *n.* [From *umpire*.] The post of an umpire; the act of one who arbitrates as umpire; the decision of an umpire; arbitration. *Bp. Hall*.

Umpire (um'pir), *n.* [From O.E. *nonpere*, *nonpere*, *nonpere*, *nonpere*, and with loss of initial *n* *œmpere*, &c., from O. Fr. *nonper*, not equal, odd—*L. non*, not, and *par*, equal, a pair. The loss of initial *n* (see *APPROX*) would be assisted by the collateral form *impir*, from *Fr. impair*, *L. impar*, uneven, odd. Lit. an odd person, in addition to a pair.] 1. A person to whose sole decision a controversy or question between parties is referred; one agreed upon as a judge, arbiter, or referee, in case of conflict of opinions. 'Three umpires in this matter.' *Shak*.

'Twixt my extremes and me this bloody knife Shall play the umpire. *Shak*.
In this great duel, Nature herself is umpire and can do no wrong. *Caryle*.

2. In *law*, a third person called in to decide a controversy or question submitted to arbitrators when the arbitrators do not agree in opinion.

Umpire (um'pir), *v.t. pret. & pp. umpired*; *ppr. umpiring*. To decide as umpire; to settle, as a dispute. *South*. [Rare.]

Umpireship (um'pir-shîp), *n.* The office of an umpire.

Umquihle (um'whîl), *adv.* [O.E. *umwile*, perhaps by inversion from A. Sax. *hwiðum* (*E. whilom*), adverbial dat. pl. of *hwil*, while, meaning at times, once, formerly, whilom.] Some time ago; formerly. 'A lost man—umquihle dead—defunct.' *Sir W. Scott*. [Scotch.]

Umquihle (um'whîl), *a.* Former; late; deceased. 'Miss Barbara Clinkscale, daughter to the umquihle, and sister to the then existing Clinkscale of that ilk.' *Sir W. Scott*. [Scotch.]

Umstroke (um'strök), *n.* [A. Sax. *um-ymc*, *ymb*, Icel. *um*, *unb*, G. *um*, around, and *E. stroke*, a line, a mark. In O.E. words with this prefix were not uncommon.] Boundary line; extreme edge. 'Such towns as stand on the very umstroke, or on any part of the utmost line of a map.' *Fuller*.

Un- A prefix derived from two sources with two uses, viz. those of negation and those of reversal or undoing, and hence privation. 1. [A. Sax. *un-*, O. Sax. and Goth. *un-*, G. *un-*, D. *on-*, Icel. *á-*, *ó-*; cog. with *L. in-*, Gr. *an-*, *a-*, Skr. *an-*, *a-*, all signifying not.] Expressive of simple negation. In this sense it is used chiefly before adjectives, past participles passive, and present participles used adjectively, and when so used it signifies simply not; as, *unable*, *unfair*, *untrue*, *untruthful*, *unwise*, *uninvited*, *unwedded*, *unseen*, *unaccommodating*, *unchanging*, *undoubting*, *unthinking*, &c. From such words again adverbs in *-ly* and nouns in *-ness* are formed; hence, *unfairly*, *unfairness*, *untruthfulness*, *unchangingly*, &c. It is also directly prefixed to some nouns to express the absence or contrary of what the noun expresses, as in *untruth*, *undress*, *unrest*, *unwisdom*, &c. Before many words of Latin origin, *un-* in the sense of mere negation, is naturally represented by *in* or by *non*, and sometimes by *dis*; thus, for *uncomplete* we have *incomplete*; for *unability*, *inability*; for *unelastic*, *inelastic* and *non-elastic*; for *unemphatic*, *non-emphatic*; for *unreputable*, *disreputable*, &c.—2. [A. Sax. *on-*, *and-*, as in *on-tícan*, to unlock, *on-leósan*, to unloose,

and-svarian, to answer, &c.; Icel. *O.sax* and Goth. *and-*, G. *ant-*, as in *ant-worten*, to answer; cog. *L. ante*, before; Gr. *anti-*, against, opposite; Skr. *anti*, over against.] Prefixed to verbs (generally active transitive) it signifies properly the reversing or annulling of the action expressed by the verb; as, *undo*, *unlearn*, *unlock*, *unmake*, &c. When prefixed to nouns it changes them into verbs implying privation of the object named by the noun or of the qualities connoted by it. Thus *unlock*, *uncowl*, *uncoat*, *unhelm*, &c., signify to deprive or divest of a frock, cowl, &c., while *unman*, *unsex*, *unshape*, signify to deprive of the qualities of a man, sex, &c. This is sometimes called *un-privative*. Another peculiar use of this *un-* is found in a few verbs, chiefly obsolete, where it is used in the sense of retract or revoke, as *unpredict*, *unsay*, *unspeak*, *unswear*, to retract a prediction, a saying, &c. As further illustrating the force of *un-* in both its senses we may remark that under the form *unlearned* we have really three words—one an adjective signifying illiterate; as, an *unlearned* man (*un-*, not, and *adj. learned*); one a true past participle of the active verb to *unlearn* (*un-* in sense 2 and *learn*); as, all you have learned must be *unlearned*; and, finally, one formed by prefixing *un-* negative to the past participle of the active verb to *learn*; as, his task is still *unlearned*. Some words with *un-* prefixed are hardly used unless qualified by *not*; thus we speak of a *striking* prospect, but we should not be likely to say an *unstriking* prospect, though we should readily say the prospect is *not unstriking*.—[Note. Adjectives and participles with the prefix *un-*, in the sense of not, being almost unlimited in number, and their meaning generally so obvious, many of them are omitted from this work, as well as their derivative adverbs in *-ly* and nouns in *-ness*. When such words, however have a special signification or usage of their own, and are not simply to be explained as equivalent to 'not' and their latter element, they are admitted into the vocabulary. As words of this kind may be instanced *unruly*, *unconscionable*, *unpretending*, *unparalleled*, *unsafe*, and the like. Verbs and nouns with *un-* as a prefix (such as *unlock*, *untruth*) are also carefully defined, as they belong to a limited class, and are not coined at will by writers or speakers. It may also be added that a number of the words below have only been inserted because used by writers of more or less eminence.]
